We haven't stopped tri-ing at Amersham

We are not quite satisfied with having an almost complete range of labelled nucleoside triphosphates to offer you. Nor are we completely satisfied with a minimum purity standard of 95-98 per cent. We shall keep trying to improve on these. In the meantime we can offer you, at very competitive prices, five more tritiated triphosphates made to our current purity and activity standards (which are at the very least as good as you will find elsewhere).

5 more tritiated deoxyribonucleoside triphosphates
Deoxyadenosine-8-T-5'-triphosphate TRK.347
current batch 9.6 Ci/mM
Deoxycytidine-5-T-5'-triphosphate TRK.352
current batch 13 Ci/mM
Deoxyguanosine-8-T-5'-triphosphate TRK.350
current batch 9.1 Ci/mM
Deoxyuridine-5-T-5'-triphosphate TRK.351
current batch 10 Ci/mM
Thymidine-(methyl-T)-5'-triphosphate TRK.354
current batch 13 Ci/mM

Further information on our labelled nucleic acid precursors is available on request.

A new
Liquid Scintillation Measuring System
from
BERTHOLD/FRIESEKE
for the measurement of soft beta emitters
such as $^3$H and $^{14}$C
in the Biological, Medical,
and Chemical Sciences

Features include:
* Sample changer for 200 samples
* Temperature-stabilized measuring and storage chamber (−5° to +30° C)
* Three independent, adjustable, energy-channels as well as two pre-adjusted channels for measurement with external standard
* Wide range amplifier with dynamics 1:10,000
* Log rate meter for quick orientation
* Evaluation by connected desk-computer.

Special circuitry, which is completely new in this field, measures delayed coincidences thus making possible the investigation of light effects associated with bioluminescence (luciferase, ATP) phosphorescence and chemoluminescence.

KINETICS

essential reading from Techmation

*Durrum's D110 Stopped-Flow Spectrophotometer*
For UV visible range with absorption, fluorescence and concentration-jump facilities, has become the standard of performance in the rapid kinetics field, for studying reactions with $t_j \leq 5$ millisec, e.g. enzyme, metal-ligand substitution, exchange and electron transfer reactions and luminescence. Can be coupled to the Warner & Swasey 501 Rapid Scanning Spectrometer to provide unequalled facilities for the detection and monitoring of reaction intermediates.

*Durrum's D-150 Temperature-Jump Accessory*
Attachment to the D110 Stopped-Flow Spectrophotometer provides additional facilities for combined temperature-jump/stopped-flow techniques. This allows the study by temperature-jump of an unstable product or intermediates prepared by the stopped-flow technique. For studying reactions with $t_j \geq 10$ microsec.

*Warner & Swasey rapid Scanning Spectrophotometer*
An important advance in the spectral range 0.2 to 15 $\mu$m with repetitive scan times as fast as 1 millisec for the study of transient biological phenomena, enzyme and chemical reaction kinetics, fluorescence, phosphorescence and flash photolysis.

*The Phoenix Dual-Wavelength/Split-Beam Scanning Spectrophotometer*
In the UV/visible range for the study of enzyme kinetics, cytochrome systems, oxidative phosphorylation, electron transport systems, photosyntheses and metabolic control systems. Provides facilities for obtaining kinetic information, conventional spectra and single sample differential spectra in the presence of highly absorbing or scattering background.

ENZYME SUBSTRATES

Aldrich Offers a Set of Six Thymidine p-Nitrophenyl Phosphate and Fluorophosphate Esters

For probing enzyme specificity and active-site electronic and spacial requirements, hydrolysis rates and for establishing enzyme purity. For example, compound (1) has been used successfully for measuring the activity of spleen phosphodiesterase,1 while compound (3) has been used for measuring the activity of snake venom phosphodiesterase by the liberation of p-nitrophenyl (monitored by uv at 400 mµ).2 Compound (1) and compounds (5) and (6) because of the substitution in the 5-position, are not degraded by spleen phosphodiesterase. Likewise, compound (3) is not degraded by snake venom phosphodiesterase. Other examples of applications of these compounds include probing the mode of enzymatic degradation by staphylococcal nuclease,3 the exonuclease from the testes of Chinook salmon,4 and others.5

References:

(1) 15,981-6 Thymidine 3′-(p-nitrophenyl phosphate) ammonium salt 100 mg. $40. 500 mg. $160.
(2) 15,979-4 Thymidine 3′-fluorophosphate ammonium salt 10 mg. $40. 100 mg. $350.
(3) 15,982-4 Thymidine 5′-(p-nitrophenyl phosphate) lithium salt 100 mg. $60. 500 mg. $200.
(4) 15,980-8 Thymidine 5′-fluorophosphate ammonium salt 25 mg. $40. 100 mg. $140.
(5) 15,983-2 Thymidine 3′,5′-di-(p-nitrophenyl phosphate) barium salt monohydrate 100 mg. $120. 500 mg. $400.
(6) 15,984-0 Thymidine 5′-phosphate-3′-(p-nitrophenyl phosphate) triphospho- nium salt 2.5 hydrate 25 mg. $60. 100 mg. $170.

All are chromatographically homogeneous in four paper chromatography systems.

RELATED COMPOUNDS

15,975-1 5′-O-Tritylthymidine benzenesate 1 g. $14. 10 g. $120.
15,977-8 3′-O-Acetylthymidine 1 g. $32. 5 g. $150. 10 g. $280.
15,978-6 Thymidine 3′-phosphate barium salt trihydrate (a useful reference standard for chromatography and electrophoresis) 100 mg. $36.
15,985-9 Thymidylyl-(3′→5′)-Thymidine sodium salt 10 mg. $40. 100 mg. $200.
15,986-7 Thymidylyl-(3′→5′)-Thymidylyl-(3′→5′)-Thymidine disodium salt 1 mg. $20. 10 mg. $150.
15,987-5 Thymidylyl-(3′→5′)-Thymidylyl-(3′→5′)-Thymidylyl-(3′→5′)-Thymidine disodium salt 1 mg. $60. 10 mg. $500.

All are important reference standards and are chromatographically homogeneous in four paper chromatography systems. The trimucleotide might be useful as an analog for condon UpUpU.
