Pye Unicam has a new automatic enzyme analyser. This is what makes it tick.

It is the new Unicam AC61 Programme Delay Unit, which holds the reacting mixture in a spectrophotometer flow cell from 5 seconds to 5 minutes while the change in absorbance is measured.

The whole system – comprised of an automatic chemical processing unit, a spectrophotometer and a recorder – has been designed for versatility and precision at low cost.

The system is simple to operate. Programming takes only a few minutes. Sample and reagent volumes are controlled by preformed templates. No initial sample preparation is required.

Enzyme reaction rates can be measured and recorded completely automatically at speeds ranging from 12 – 60 an hour, while other chemical analyses can be completed at up to 120 samples an hour.

Above all, the system is backed by methods proved in the Pye Unicam Applications Laboratory and over 20 method sheets are currently available including LDH, CPK, SGOT and SGPT in serum.

Find out more about the Unicam Automatic Analytical System by telephoning or writing to Pye Unicam today.

CONTENTS

Breathing patterns and regional ventilation distribution in tetraplegic patients and in normal subjects. By B. BAKE, A. R. FUHL-MEYER and G. GRIMBY

The effects of synthetic human and salmon calcitonins on electrolyte excretion in the rat. By C. C. WILLIAMS, E. W. MATTHEWS, JANIE M. MOSELEY and I. MACINTYRE

Urinary excretion of nitrogen from [15N]valine, [15N]leucine and [15N]isoleucine in malnourished and recovered children. By W. W. C. READ, D. S. MCLAREN and MARIE TCHALIAN

The antidiuretic action of diazoxide. By J. E. F. POHIL, H. THURSTON and J. D. SWALES

Studies in man with 3F. By D. J. HOSKING and M. J. CHAMBERLAIN

Electrolyte changes in patients with subarachnoid haemorrhage. By I. M. JAMES

The influence of numerous pregnancies and lactations on bone dimensions in South Africa Bantu and Caucasian mothers. By A. R. P. WALKER, BARBARA RICHARDSON and FAITH WALKER

Orthostatic changes of haemodynamics, renal function, plasma catecholamines and plasma renin concentration in normal and hypertensive man. By M. MOLZAHN, TH. DISSMANN, S. HALIM, F. W. LOHMANN and W. OELKERS

SHORT COMMUNICATION

A calcitonin-resistant primary action of parathyroid hormone in rats: calcium shift into bone. By C. J. ROBINSON, B. RAPFERY and J. A. PARSONS

ENZITE™ a stable and reusable form of enzyme activity.

for the purification and isolation of enzymes.

for the purification and isolation of antibodies and antigens.

for the insolubilization of proteins.

The combined efforts of Miles-Seravac and Miles-Yeda have provided the research investigator with the world's most comprehensive selection of insolubilized biochemicals.

The following technical brochures listing products with full specifications, methods of use and references are available on request.

ENZITE™ brochure No. 2. Insolubilized Enzymes

ENZITE™ brochure No. 3. Insolubilized Biochemicals.

Special attention!

GLYCOSYLEX-A™ (Insolubilized Concanavalin A)

For THIOL Groups -- DTNB, ALDRITHIOLS and ANALOGUES

Previous methods for the assay of dithio groups required a reducing agent to convert each dithio into 2 thiol groups. A new method was based on the observation that thionitrobenzoate released by reaction of protein thiol groups with DTNB could reduce dithio groups in the protein and progressively convert them to mixed disulfides with thionitrobenzoate, but without altering the titer, since only 1 equivalent of thionitrobenzoate (TNB⁻) per thiol group originally present is left at the end of this conversion: Protein-S⁻ + DTNB → Protein-S-TNB + TNB⁺. By altering the pH from 8.1 to 10.5 an alkaline fission of mixed disulfides between protein thiols and thionitrobenzoate could be induced. An alternative method relies on prior separation of these protein mixed disulfides by gel filtration and on the release of thionitrobenzoate by reaction with dithiothreitol. The number of disulfide bonds is given by ½ [TNB⁻ after pH 10.5] or by ½(TNB⁻ after Sephadex and DTDTN before Sephadex and DTDT). Criticism by the same authors of the molar extinction coefficient of 13,600 reported by Ellman cannot be substantiated. Only was the value reported by Ellman for the thionitrobenzoate ion and not the thionitrophenolate as claimed, but the value was confirmed by many others who checked it carefully. Indirect confirmation is provided by the many workers who found agreement between the thiol content determined with DTNB and by other methods. Alkaline fission of DTNB was investigated in detail and molar extinction coefficients for thionitrobenzoate (13,600 at 412 nm, 12,600 at 825 nm), DTNB (17,500 at 325 nm; 2,800 at 748 nm), Aldriethiol-2 (13,900 at 233 nm, 5,700 at 281 nm), 2-mercaptoptyridine (6,200 at 238 nm, 8,700 at 343 nm, 550 at 740 nm), Aldriethiol-4 (16,100 at 247 nm, 4-mercaptoptyridine (9,600 at 230 nm, 19,800 at 324 nm) were reported. In view of the above results, some earlier work must be re-interpreted. Many additional uses of our reagents for thiol groups have been studied. Studies of glycogen phosphorylase from bovine spleen, acid-stable α-amylase from Aspergillus, muscle aldolase, potato phosphorylase, muscle triose phosphate isomerase, citrate synthase, yeast inorganic pyrophosphatase, rat liver cystathionase, 3-phosphoglycerate kinase from muscle and yeast, purine nucleoside phosphorylase, ATP transphosphorylase from calf brain, porcine pancreatic lipase and papain, are typical.
