Success

for the rock climber, must in some part depend upon the **quality** and **reliability** of the equipment he uses.

Likewise for you, the researcher, these virtues must apply to your reagents for them to contribute to **your** success.

If your 'rock climb' is Biomembrane Research Boehringer Mannheim offer you some new preparations specifically made for your type of work.

ATP Analogues: AMP-PNP, Cat. No. 15281.
AMP PCP, Cat. No. 15842.
GTP Analogues: GMP-PNP, Cat. No. 15281.
GMP PCP, Cat. No. 15843.

Comparison of the P-X bond distances and P-X-P bond angles between the β and γ phosphate groups of AMP-PNP, AMP PCP and ATP is of particular interest.¹

This X-ray analysis shows that AMP-PNP has retained similar structural characteristics to ATP. The enzymic cleavage by myokinase, hexokinase and ATPases is inhibited, whereas the adenyl cyclase from plasma membranes converts AMP-PNP to cyclic AMP and PNP.² Thus membrane bound ATP utilizing enzymes could possibly be distinguished using this inhibitor.³
