

NOW IT'S SO EASY TO MEASURE CYCLIC GMP

Now you can measure
cyclic GMP simply and
accurately with our new RIA kit.

The kit is based on a highly
specific and stable antibody.
This, combined with the high
specific activity of the tritium label,
makes the assay extremely sensitive—
with a detection limit 0.04 pmol.
In addition it can be used over a wide
range of cyclic GMP levels, with
a linear calibration curve in the range
0 to 8 pmol.

Add to this simple pipetting
steps and a short incubation time of
1½ hours, and you can see why our
new cyclic GMP kit will join our well-
established cyclic AMP kit as an
invaluable aid to your research.

This volume records the proceedings of a symposium held in University College London in April 1974. Each of the ten papers is by an international authority and presents a survey of recent progress in certain aspects of the study of glycoproteins. Topics include methods of analysis, the nature of the carbohydrate-peptide linkage, heterogeneity of glycoproteins, sites of glycosylation, assembly of the carbohydrate moieties, immunoglobulin synthesis, sialic acid modifications, the role of sialic acid and the structure of blood-group-specific glycoproteins in normal and transformed cells.
