Proteinase K

A powerful serine endo-protease (EC 3.4.21)

Proteinase K & Proteinase K-cellulose-bound

- chromatographically purified and crystallized
- extremely low in RNA-ase and DNA-ase activity

Proteinase K is a powerful serine endo-protease from
Tritirachium album limber

molecular biology For the isolation of high molecular weight nucleic acids

serology For the analysis of membrane proteins

Leu-[³H]enkephalin now available at high specific activity!

[tyrosyl-3, 5-³H] Enkephalin (5-L-leucine)
30-60 Ci/mmol
TRK 516

Leu-enkephalin is one of two endogenous substances recently discovered in brain which are natural ligands for opiate receptors and which have now been identified as pentapeptides.

Volume 357

Contents

Production of antisera to synthetic benzyl-oxycarbonyl C-peptide of human proinsulin
O. K. Faber, J. Markussen, V. K. Naithani and C. Binder

A new semisynthesis of human insulin
R. Obermeier and R. Geiger

Hydrolysis-resynthesis equilibrium of the lysine-15-alanine-16 peptide bond in bovine trypsin
inhibitor (Kunitz)
H. Tschesche and S. Kupfer

Enzyme induction in Streptomyces hydrogenans,
VI. Studies on the induction of 20β-hydroxy-
steroid dehydrogenase using immunological
methods
J. Betz, B. Lotz and L. Träger

Large scale purification of the acetycholin-
esterase from bovine caudate nucleus by affinity
chromatography
K.-P. Rueß, M. Weinert and M. Ließlnder

Physico-chemical characterisation and crystalli-
sation of immunoglobulins and their frag-
ments: A contribution to the three-dimensional
structural determination of antibodies, III:
Human immunoglobulin KOL, a myeloma
protein of the type IgG, γK₂, Gm(f)+. Comparative
studies on dissolved and crystalline
material
W. Palm

Physico-chemical characterisation and crystalli-
sation of immunoglobulins and their frag-
ments: A contribution to the three-dimensional
structural elucidation of antibodies, IV: The
Fab fragment and the Fc fragment of human
immunoglobulin KOL; Isolation and crystalli-
sation
W. Palm

Bis(monoacylglycerol)phosphate — a marker
lipid of secondary lysosomes?
W. Streimel and H. Debuch

Effect of substrate and small doses of cortisone
on the induction of tryptophan 2,3-dioxygenase
I. Donner and H. Kröger

Phenylalanine-tRNA synthetase from baker’s
yeast: Specificity and quantitation of affinity
elution with tRNA
F. v. d. Haar

1,8-Disubstituted analogues of [Ile5] and
[Val5]-angiotensin II: Difference in potency and
specificity of angiotensin II-antagonistic activity
B. A. Schoelkens, H. Wissmann, E. Lindner and
R. Geiger

Purification and characterization of N-acetyl-
neuraminate lyase from Clostridium perfringens
S. Nées, R. Schauer, F. Mayer and K. Ehrlich

Multiple forms of human acrosin: Isolation and
properties
W.-D. Schleuning, R. Hell and H. Fritz

Carboxypeptidase N from pig serum
L. Jeanneret, M. Roth and J.-P. Bargetzi

The sequence determination of a protein in a
micro scale: The sequence analysis of riboso-
mal protein L34 of Escherichia coli
R. Chen

Short Communication

Coenzyme properties of some Ade-1- and Ade-1-
N* substituted NAD® derivatives
G. Grenner, H.-L. Schmidt and W. VölkI

Gel isoelectric focusing of highly purified bovine
parathyrin
J.-P. Nordmeyer, G. Dorn and H. Mayer

Phospholipase A₂ activity in human γ-globulin
fraction
R. Scherer, W. Huber-Friedberg, A. Salem and
G. Ruhenstroth-Bauer

No. 40 THE METABOLISM AND FUNCTION OF GLYCOPROTEINS
Edited by R. M. S. SMELLIE and J. G. BEELEY
1974 189 pp. £7.00 ($17.50)

This volume records the proceedings of a symposium held in University College London in April 1974. Each of the ten papers is by an international authority and presents a survey of recent progress in certain aspects of the study of glycoproteins. Topics include methods of analysis, the nature of the carbohydrate-peptide linkage, heterogeneity of glycoproteins, sites of glycosylation, assembly of the carbohydrate moieties, immunoglobulin synthesis, sialic acid modifications, the role of sialic acid and the structure of blood-group-specific glycoproteins in normal and transformed cells.

Nitroxide spin labels

Spin labeling, a term coined by Stone et al., refers to the use of stable free radicals as reporter groups. The paramagnetic resonance spectrum of the spin label, or the effect of the spin label on nuclear resonance spectra, or both, can provide significant information on molecular structure and dynamics in biological systems. The most commonly used spin labels are molecules which contain a nitroxide moiety.

Nitroxides are reactive under a variety of experimental conditions, stable in aqueous solutions to moderate heating (up to 70-80°C) and to pH changes over the range of 3 to 10, and nontoxic to most biological systems. They can be reduced to the hydroxylamines by many mild reducing agents, but are not affected by two-electron reductants. Reduction to the secondary amine requires stronger reducing agents than are usually encountered in biological systems.

Nitroxide spin labels have been extensively used in the studies of biomembranes and membrane models, the geometry of binding sites (e.g., antibody combining sites, enzyme active sites), conformational changes in macromolecules (proteins such as hemoglobin, nucleic acids such as rRNA), enzyme mechanisms, and immunoassays of drugs. For the aforementioned studies, compounds such as ADP, ATP, vitamin B12, hemoglobin, morphine, etc., have been spin-labeled with nitroxides.

The preformed nitroxide spin labels we offer carry amino, hydroxyl or oxo functions through which specific compounds of interest may be attached. Alternatively, a 4,4-dimethyl-2-oxazolidinone-N-oxyl (or simply "doxyl") moiety can be synthesized by the method of Ksana et al. from a keto group in the molecule to be studied.

In addition to their use as spin labels, nitroxides find other applications simply because they are stable free radicals, e.g., 17,614-1 and 17,948-5 are inhibitors in the polymerization of dienes and vinyl compounds. These two compounds are efficient antioxidants in trialkylboranes, lipids, feeds (to stabilize carotene), and are inhibitors in the thermooxidative degradation of polycaproamide (nylon). They also possess antitumor activity, particularly against hematopoietic malignancies in the peripheral blood and bone marrow.
