BIOCHEMICAL RESEARCH TECHNIQUES

A Practical Introduction

edited by J.M. Wrigglesworth, *Department of Biochemistry, Chelsea College, University of London*

The main purpose of this book is to help research students expand their competence in techniques they might not yet have applied to their research problems, and to aid established research workers to familiarize themselves with techniques outside their speciality. Chapters cover various research techniques in biochemistry and basic medical sciences, presenting a brief overall view of the technique including any necessary theory and then concentrating on practical details to enable the reader to assess whether the technique would provide useful information in his or her particular line of research.

PROGRESS IN PESTICIDE BIOCHEMISTRY AND TOXICOLOGY Volume 3

edited by D.H. Hutson and T.R. Roberts, *Shell Research Limited, Sittingbourne*

Information on the biochemistry of pesticides is distributed widely throughout the literature and ranges from insect, plant and soil biochemistry through to mammalian toxicology. This series is one in which selected aspects are reviewed and, where possible, interrelated by experts in the various fields. In selecting areas for review, account is taken of new or changing aspects of the science, including techniques, and of changes in the importance or use patterns of the chemical classes of pesticides.

LEUKOTRIENES AND OTHER LIPOXYGENASE PRODUCTS

edited by P.J. Piper, *Reading in Pharmacology, Institute of Basic Medical Sciences, Royal College of Surgeons of England*

This book comprises the proceedings of a 2-day Symposium on this subject, held at the Royal College of Surgeons of England, in October 1982. It contains nine long papers of invited lectures and 34 accounts of original work, presented at the meeting. The strands are drawn together in the Editor's Preface.

INTRACELLULAR CALCIUM Its Universal Role as Regulator

by A.K. Campbell, *Department of Medical Biochemistry, Welsh National School of Medicine*

The last twenty years have seen major advances in our understanding of how electrical and chemical stimuli cause changes in the behaviour of cells. This book presents the argument and experimental evidence that intracellular calcium plays a central role in provoking chemical, electrical and structural changes in cells. There are ten chapters, more than 1500 references, and a subject index. Throughout the book an attempt has been made to identify physiological or pathological problems and then to ask how the chemistry of these phenomena can be elucidated.

BIOCHEMISTRY FOR THE MEDICAL SCIENCES

by E.A. Newsholme, *Department of Biochemistry, University of Oxford* and A.R. Leech, *Gresham's School at Holt, Norfolk*

This book is designed to provide students of the medical and biochemical sciences with a complete grounding in basic metabolic biochemistry. In addition the subject is extended by an explanation of how each metabolic pathway is directly related to physiology, pharmacology and clinical medicine. Emphasis is given throughout the text to how metabolic biochemistry is related to clinical problems encountered frequently in the consulting room or the ward.

BIOPHYSICS OF WATER Proceedings of a Working Conference held at Girton College, Cambridge, June 29 - July 3 1981

edited by F. Franks and S. Mathias, *Department of Botany, University of Cambridge*

This book discusses the central role of water and the many ways in which water participates in life processes. Since water was on this planet long before life, all the chemical processes associated with the evolution of living organisms have had to adapt themselves to the eccentric physical properties of the available aqueous substrate.

BIOCHEMICAL SOCIETY SYMPOSIA NO. 47

Messenger RNA and Ribosomes in Protein Synthesis

Edited by C. F. PHELPS
and H. R. V. ARNSTEIN

The Biochemical Society's Forty-Seventh Symposium, held in London in December 1981, assembled some of the leading workers in this area of biochemistry. The subjects for discussion were chosen for their timeliness and distinctiveness, and included accounts of ribosome and messenger RNA structure and function, initiation factors, caps and ribonucleoproteins, as well as consideration of the processes leading to the distribution of newly synthesized proteins within the cell. The papers presented are now published in this volume.

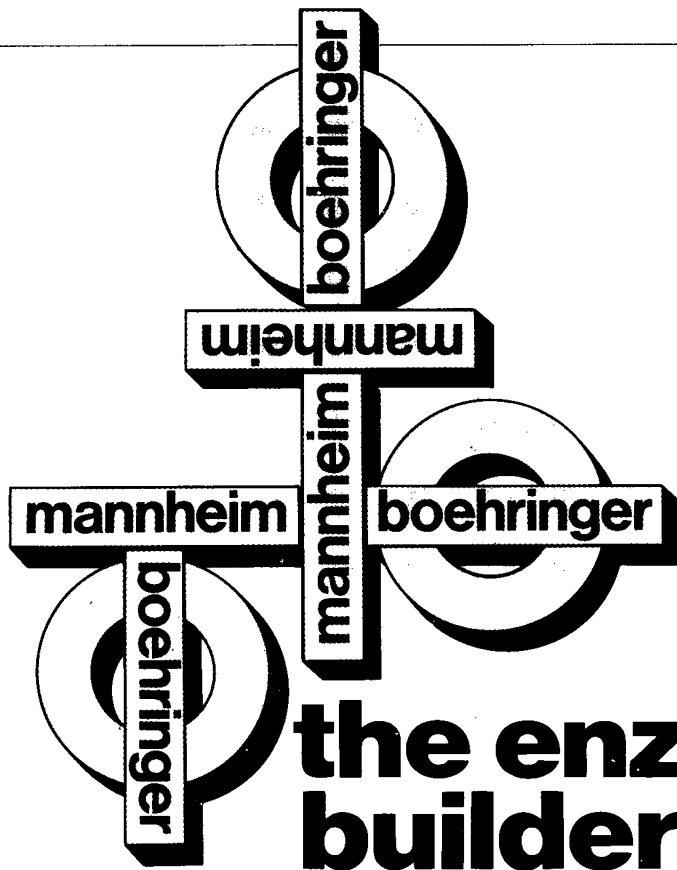

List of contents and authors:

Preface. Prokaryotic Ribosome Structure: a Kinetic View by C. G. Kurland. *Structural Aspects of Eukaryotic Ribosomes* by R. A. Cox & J. M. Kelly. *The Secondary Structure of Ribosomal RNA, and its Organization within the Ribosomal Subunits* by R. Brimacombe. *Secondary Structure of Eukaryotic Messenger RNA* by C. P. H. Vary & J. N. Vournakis. *Studies on the Structure and Biogenesis of Yeast Ribosomes* by M. Cannon. *Translation Mechanism in Prokaryotes: Structure and Expression of Escherichia coli Initiation Factor IF3 Gene* by M. Grunberg-Manago, M. Springer, J. A. Plumbridge, S. Blanquet, G. Fayat & C. Sacerdot. *How do Eukaryotic Ribosomes Recognize the Unique AUG Initiator Codon in Messenger RNA?* by M. Kozak. *5'-Terminal Caps, Cap-Binding Proteins and Eukaryotic mRNA Function* by A. J. Shatkin, E. Darzynkiewicz, Y. Furuichi, H. Kroath, M. A. Morgan, S. M. Tahara & M. Yamakawa. *Association of an M_r 50000 Cap Binding Protein with the Cytoskeleton in BHK Cells* by H. Trachsel, A. Zumbé, C. Stähli, M. Hübelin & N. Sonenberg. *Messenger Ribonucleoprotein Complexes in Gene Expression* by H. R. V. Arnstein. *Mechanism of Protein Translocation Across the Endoplasmic Reticulum* by P. Walter & G. Blobel. *Synthesis and Maturation of the Erythrocyte Anion Transport Protein — an Internal Sequence for Membrane Insertion* by H. F. Lodish & W. A. Braell. *Subject Index.*

213 pp. ISBN 0 904498 14 X £25.00 (US\$57.50)

the enzyme builders

biotechnology line

Boehringer Mannheim have used latest technology in genetic engineering to produce new enzymes such as α -Galactosidase from *E. coli*, and β -Galactose dehydrogenase S from *pseudomonas fluorescens* cloned on *E. coli*.

These enzymes are noted for

- High specific activity for greater economy
- Exceptional purity for minimal interference
- Excellent stability for long term reliability

These are just two of the enzymes which have joined BM's biochemical programme, suitable for analytical, metabolic and molecular studies. There are many more on the way.

Ask us now for the Biochemical Catalogue showing the complete range of enzymes, substrates and cofactors and join our biotechnology line.

Bell Lane, Lewes, East Sussex, BN7 1LG.

The company dedicated to serving people in laboratories everywhere.
