Genes and Proteins in Immunity

Traditionally, the multiplicity of the reactions involved in immune responses have been a source of excitement to some and yet frustration to many. However, with the advent of modern techniques in molecular biology, a considerable understanding of these complexities has begun to emerge. In recognition of the enormous contribution made to this field by Rodney Porter, the Biochemical Society held a special symposium in his honour in Oxford during July 1985. This volume contains the papers that were presented in tribute at the symposium.

SECOLOGANIN:
Nature’s Keystone

It has been almost two decades since Battersby first recognized secologanin as the last non-nitrogenous biosynthetic precursor of virtually all monoterpenoid indole alkaloids. Not as well appreciated, however, is its versatility as a building block for the synthesis of chiral natural (and unnatural) products: here is a molecule with a dense array of contiguous chiral centers and reactive functional groups. Also, the addition of secologanin to tissue cultures may well increase the biosynthetic yield of indole alkaloids. Some examples of the synthetic utility of secologanin are given below.
