B.D.H. VITAMIN-FREE DIET
(FOR FEEDING RATS)

The demand for a vitamin-free diet mixed ready for use in rat-feeding experiments as carried out in the determination of Vitamin A and Vitamin B has led to the introduction of the B.D.H. Vitamin-Free Diet. The Diet consists of inactivated casein, starch, a hardened vegetable oil, and a mixture of salts. Every batch is biologically tested in the B.D.H. Physiological Laboratories before it is passed for issue.

THE INSTITUTE OF CHEMISTRY OF GREAT BRITAIN AND IRELAND

The Institute of Chemistry was established in 1877 to provide the Government and the public with the means of recognizing those who have been properly trained and proved to be competent to practise chemistry as a profession. In 1885 the Institute was incorporated by Royal Charter with authority to grant certificates of competency, and to register persons qualified to practise. The aims of the Institute include the elevation of the profession of chemistry and the maintenance of the efficiency, integrity and usefulness of persons practising the same, by compelling the observance of strict rules of membership, and by setting up a high standard of scientific and practical efficiency. Particulars of the Regulations and Examinations of the Institute can be obtained (free), on application.

All communications to be addressed to the Registrar

NUTRITION ABSTRACTS & REVIEWS
ISSUED UNDER THE DIRECTION OF
THE IMPERIAL AGRICULTURAL BUREAUX COUNCIL, THE MEDICAL RESEARCH COUNCIL AND THE REID LIBRARY

Editors:
JOHN BOYD ORR
Imperial Bureau of Animal Nutrition,
Aberdeen
HARRIETTE CHICK
Lister Institute,
London

The Editors, in co-operation with Corresponding Editors abroad scrutinize upwards of 500 periodicals and, with the assistance of a competent panel of abstractors issue abstracts of papers published throughout the world dealing with the subject of Nutrition in all its aspects.

The abstracts are conveniently arranged in three main sections: (1) Chemistry and Physiology of Nutrition, (2) Human Diet in Relation to Health and Disease, and (3) Feeding of Domestic Animals. These sections are designed to meet the requirements respectively of the research worker, the medical practitioner and dietician and the practical farmer.

Four numbers appearing in July, October, January and April of each year constitute a Volume, the subscription price for which is 21/- Volume V begins July 1935.

Subscriptions may be paid through any bookseller or direct to
THE SECRETARY, COMMITTEE OF MANAGEMENT "NUTRITION ABSTRACTS & REVIEWS" REID LIBRARY, ROWETT INSTITUTE, ABERDEEN, SCOTLAND
and even the London strain of Wistar rat may change with the times. There is no known method of preventing the occurrence of mutations.

The intensive inbreeding applied now for ten years to these rats is designed to counteract the occurrence of mutations and to maintain as far as possible a homozygous stock. More than this cannot be achieved and has not been attempted.

The success of the policy of intense inbreeding, dictated by theoretical genetic considerations, has been empirically justified by the increased statistical validity of results obtained in work for which these animals are used in preference to any others.

The stock is as viable as it is constant. Low infantile mortality, expressed as the percentage of animals born alive that survive at weaning, has been shown by this strain for ten years. Its average value has been 86·8 per cent, fluctuating somewhat, from 81·2 per cent to 93·6 per cent.

The above figures are calculated from the records of nearly 36,000 animals. About half of these have been used for work in the Glaxo Research Laboratory, the rest having been supplied to outside investigators. Adequate stocks of these animals are now available, though it is always advisable for prospective users to give notice in advance of their probable requirements.
