Labelled Compounds

A NEW SERVICE FOR WORKERS USING RADIOACTIVE TRACER TECHNIQUES

Our aim at the Radiochemical Centre is to assist research workers who use or propose to use radioactive tracer methods.

From our wide range we can frequently supply labelled compounds in the exact chemical form required and so save users much tedious preparative work. For instance, we stock regularly about 50 compounds of carbon-14 ready for prompt despatch by air to any part of the world.

Of the shorter lived isotopes such as S-35, P-32, I-131, we list about 300 compounds, those in steady demand being prepared regularly, while others are made to order.

Our experience over several years in the chemical and biological synthesis of these labelled compounds on a large scale enables us to offer preparations of high specific activity at economical prices.

We invite interested workers to write for price lists and, in the case of work calling for any compound that is not at present listed, we will gladly propose the nearest available intermediate, and suggest a method of preparation.

Please send your enquiries to:

RADIOCHEMICAL CENTRE, AMERSHAM, BUCKINGHAMSHIRE, ENGLAND
The New Unicam SP.600 Spectrophotometer. This new instrument makes possible accurate chemical analysis by measurement of light absorption within the visible and near infrared regions of the spectrum. Analysis of an unknown solution or inter-comparison of up to four samples can readily be carried out.

The bandwidth of the instrument is less than 30 Å over the greater part of the wavelength range, and not more than 100 Å at the extreme limits. Stray light is kept within the normal limit of 1% over the whole range by introducing a filter for work below 4,000 Å. Readings may be made as either percentage transmission or optical density.

B.D.H. Concentrated VOLUMETRIC SOLUTIONS

The accuracy of solutions prepared as directed from B.D.H. Concentrated Volumetric Solutions is within the factor limits of 0.999 and 1.001.

The well-known cylindrical 7-ampoule rigid carton has disappeared. B.D.H. Concentrated Volumetric Solutions are now issued in a new package of six ampoules. This gives even more security than the original container, costs less, and is more compact.

While the ampoules are unchanged, increasing production and the more economical packing enable them to be supplied at much lower prices. The new range includes a carton of solutions for the precise determination of water hardness by the Schwarzenbach method. Please ask for a copy of the price list.
Items from the range of

LABORATORY PREPARATIONS

OXOID Bacteriological Peptone. A preparation of the highest grade in which batch to batch variation is reduced to a minimum. Each batch is tested for its ability to give maximum bacterial growth, indol production, chemical composition and freedom from sugars.

OXOID Dehydrated Liver Infusion. An extremely potent source of bacterial growth factors. Recommended for the preparation of all media which specify liver infusion.

OXOID Bacteriological Yeast Extract. Contains all the solubles of the original yeast. An excellent source of the growth promoting factors for use in microbiological culture media.

OXOID Test Tube Caps. An improvement on cotton wool for closing Test Tubes. Can be used repeatedly and ensure sterility for long periods. Plain or in eight colours to fit ½", ¾", ¾" and 1" rimless test tubes.

Laboratory Preparations are obtainable from any Laboratory Supplier or direct from

OXO Limited, Medical Dept, Thames House, London, E.C.4

ROTARY WARBURG APPARATUS
The most convenient and space saving apparatus for micro-respiration work. Supplied with the new rod-shaped, double-capillary manometers, which are also available separately incl. metal supports. Warburg Apparatus with illumination equipment for photosynthesis made to order.

AUTOMATIC FRACTION COLLECTORS
These fully automatic machines collect fractions by weight, and are now supplied with interchangeable turntable-racks to take either 70 x 3 ml., 50 x 15 ml., or 30 x 60 ml. calibrated test tubes. The two smaller sizes can be arranged for tandem collection from two columns.

CHROMATOGRAPHY EQUIPMENT

SEMI-ULTRA CENTRIFUGES
This new centrifuge of the most advanced design has a capacity of 300 ml., and runs without vibration at 15,000 r.p.m., producing a centrifugal force of 29,000 x g. Ultra Centrifuges for preparative and analytical work up to 50,000 r.p.m. are also available.

MICRO ELECTROPHORESIS APPARATUS
Easy manipulation, short analysis time, accurate quantitative results—these are the main features of this instrument, which employs a Jamin Interferometer. Also available with Schlieren Attachment.

PAPER ELECTROPHORESIS APPARATUS
Mainly intended for qualitative clinical routine tests on blood serum. The tank will take up to 6 strips of filter paper, and is available either by itself or complete with D.C. power unit.

Physical characteristics are important!

The pharmacological efficiency of a therapeutic agent may depend to a great extent on special physical characteristics. For example, the first and basic requirement of an infusion solution for the treatment of such conditions as haemorrhage and shock is that it should restore and maintain the circulatory volume and it is essential, therefore, that the physical properties of the solution should approximate as closely as possible to those of blood plasma. It is necessary that the colloidal component should have a molecule or molecular aggregate that will not readily escape from the circulation but will remain there long enough to allow natural replacement of the recipient's plasma proteins to take place; the solution should exert a colloidal osmotic pressure similar to that of the plasma proteins, and it should have a viscosity similar to that of blood to avoid an unduly raised peripheral resistance.

*Plasmosan*, a 3.5 per cent solution of a selected grade of polyvinylpyrrolidone with electrolytes, fulfills these and other requirements of a plasma substitute, and can be recommended as a readily available, safe and effective alternative to blood plasma.

**Supplies**: standard British Transfusion bottles of 540 c.c. in cartons of 4.

PITMAN "Microbiology" Series

The Microbiological Assay of the Vitamin B-Complex and Amino Acids

By E. C. Barton-Wright, D.Sc., F.R.I.C.

An entirely new study of this branch of biochemical analysis. The main part of the book is preceded by a critical assessment of the validity of microbiological assays and methods of computation. Each assay is then described in detail so that the procedure is clear to the beginner. Cultural details for the organisms used in the assays, and directions for the preparation of stock solutions, are given in the Appendices, and there are useful bibliographies at the conclusion of each chapter. 18s. net.
