

Supplementary Data

1. Bioinformatics analysis of CRISPR-Cas systems from *Methanothermobacter thermautotrophicus* DH (Mth).

Methods

All current viruses, plasmids, and *M. thermautotrophicus* genomes analyzed in this study were downloaded from EMBL-EBI (www.ebi.ac.uk/genomes) in June 2014. CRISPR loci were predicted using CRT [1] and CRISPR Finder [2] in all *M. thermautotrophicus* genomes (AE000666, CP000102, CP000678, CP001710, CP001719, and CP002772). CRISPR loci orientations were predicted using the CRISPRstrand tool [3] and calculating the consensus repeat for each CRISPR loci was done using MAFFT [4] tool and Cons program from EMOSS package [5]. The consensus repeats were aligned using MAFFT [4] and a hierarchical cluster tree was generated [6] based on distance matrix from the alignment. CRISPR spacers were compiled into a single dataset and compared against virus/ plasmid genomes using FASTA tool version 36.3.6 [7] with optimizing allowed hits for each virus/plasmid genome. To do this, we used a shuffling approach to estimate the significance of a hit between the virus/plasmid genomes and the CRISPR spacer with a certain number of mismatches.

Results

Consensus CRISPR repeats of *M. thermautotrophicus* were diverse and we attempted to cluster them into two main classes based on distance matrix. In total 17 CRISPR loci yielded 581 spacers (Figure S2 and additional file - Summary_CRISPRloc.xlsx-). Approximately 25% and 17% of the spacers from CRISPR1 and CRISPR2 in *Methanothermobacter thermautotrophicus* strain ΔH match database virus/plasmid sequence with a maximum nine nucleotides mismatches (Fig1, and Additional file Methanothermobacter_spacers_matches_virus_plamid.xlsx). A hierarchical cluster tree was generated based on consensus repeats revealed two main clusters (Figure S2C). Spacers from the CRISPR-1 cluster, adjacent to ORFs mth1077-1091 (*cas8'* is mth1090, Figure 1), were matched to virus/plasmid sequence, and we detected a conserved dinucleotide motif CC that was located upstream (-2, -3) of the protospacer in virus/plasmid genomes (Figure S2D). CC was proposed as a putative PAM for this organism.

2. Supplementary Materials

(A) List of primers used for mutagenesis of Mth Cas8'

Mutagenesis of Cas8' to generate K68A is described in [8]. New mutations for this work were made using the Quick Change method with primers as below:

D151G-A1 5'-CGAGAAAATTTAATTGGTAATAATTCAGAGGAAC

D151G-B1 5'-GTTCTCTGAATTATTACCAATTAAATTTTCTCG

N153A-A 5'-ATTTAATTGATAATGCTTCAGAGGAACTGG

N153A-B 5'-CCAGTTCCTCTGAAGCATTATCAATTAAT

N536G-A1 5'-CCAGAGAGAACAACATAGGTCAGCTAATATCAATCC

N536G-B1 5'-GGATTGATATTAGCTGACCTATGTTGTTCTCTCTGG

(B) List of oligonucleotides used to generate substrates tested for Mth Cas8'

The following oligonucleotides were used to form substrates shown in Figure 2.

Minus (-) PAM (5'-AAA) R-loops: ELB103 was annealed to ELB103-B and either crRNA2 (-5' handle) or crRNA3 (+5' RNA handle). The AAA position is in bold and underlined.

ELB103:

5'-
GATAAGCTTAA**AAA**TAACATCAACCACCTACAATCCAAATGTGTGGTATGGTTTTTACGGATCCT
GG

ELB103-B:

5' -

ATC

crRNA2:

5'-CCAUACCACACAUUUGGAUUG

crRNA3:

5'-ATTGAAATCCAUACCACACAUUUGGAUUG

Plus (+) PAM (5'CCN, CCC was used) R-loops: ELB108 was annealed to ELB108-B and either crRNA2 (- 5' RNA handle) or crRNA3 (+5' RNA handle). The CCN (CCC) PAM is in bold and underlined.

ELB108:

5'GATAAGCTT**ACCC**TAACATCAACCACCTACAATCCAAATGTGTGGTATGGGGGTTACGGATC
CTGG

ELB108-B

5'
CCAGGATCCGTAACCCAACGCAACACACGGGTTTCGGTTAGGTGGTTGATGTTAGGGTAAGCT
TATC

Partial duplex structures were constructed as above with ELB10X and ELB10X-B for all permutations.

Complete duplex structures constructed as follows:

Duplex (- PAM AA): ELB 102 annealed to ELB103:

ELB102:

5'
CCAGGATCCGTAACCAACCATACACACATTTGGATTGTAGGTGGTTGATGTTATTTTAAGCTTA
TC

The following oligonucleotides were used to form 3' and 5' flap structures for assays of nuclease activity in Figure 4:

3' RNA or DNA single-strand Flaps: ELB104 or ELB104RNA was annealed to crRNA1 or crDNA1 for each flap, giving either 3' ssRNA or 3' ssDNA overhang in either RNA-RNA duplex, RNA-DNA hybrid duplex or DNA-DNA duplex.

ELB104:

5'-TAACATCAACCACCTACAATCCAAATGTGTGGTATGG

ELB104RNA:

Supplementary Figure Legends

Figure S1. Alignment of amino acid sequences *Haloferax volcanii* (Hvo) Cas8, *Methanothermobacter thermautotrophicus* (Mth) Cas8' and *Clostridium tetani* (Cte) Cas8b, using

Clustal X. Amino acids subjected to mutational analysis in this work are highlighted to the right of the alignment.

Figure S2. Coomassie stained SDS-PAGE (10% acrylamide) of purified Mth Cas8' proteins as labelled. Protein concentration was measured using the Bradford's reagent method for loading of 2 ug of protein in each case.

Figure S3. Bioinformatics analysis of *Methanothermobacter thermautotrophicus* (Mth) CRISPRs. Additionally, *Haloferax volcanii* has a CRISPR locus C, that is not shown here but is detailed in [14] (A). Cartoon of the Mth genome labelled with CRISPR loci and associated cas genes. CRISPR-1 is associated with a type IB system that contains Cas8' (mth1090), Cascade, Cas3, Cas1 and Cas2, and also a type IIIA system. A type IIIB CRISPR system is also present, and a CRISPR-2 locus. (B). Summary of CRISPR-1 array and associated cas genes, and the CRISPR-2. The 123 spacers of CRISPR-1 and 45 of CRISPR-2 are colour-coded triangles with the key indicating sequence matches of some spacers with plasmids (pME2200, pMTBMA4, pFV1, pFZ1, pME2001) or virus (psiM2 and psiM100). (C). Phylogeny of two major CRISPR clusters from Mth. (D). Analysis of plasmid/phage sequence matching the spacers shown in (B) allowed identification of putative PAM for Mth (5' CCN) that is in agreement with a previous study [16], described in the results and supplemental results.

Figure S4. 8% acrylamide SDS-PAGE summary of co-purified Mth Cas5-Cas7. Cas5 is a fusion to *E. coli* maltose binding protein to retain solubility using *E. coli* expression, detailed in methods. Purified Cas8' is included for comparison.

Figure S5. Graph of EMSA for Cas8' and D151G/N536A interference defective Cas8' mutant proteins binding to R-loop + PAM. Substrate (1 nM) is ³²P labelled on the strand marked with * and assays were in triplicate to determine mean values for plotting with standard error bars, deriving a binding affinity expressed as K_d.

Figure S6. Western blot summaries of physical interaction between MBP-Cas5-7 and (His)₆ Cas8' wild type and mutant proteins, see also Figure 3B. Catalytically defective Cas8' D151G and N536A were detected in elution (E) after binding to MBP-Cas5-7 immobilised on amylose resin. Further experimental details are given in the results and Figure 3B.

Figure S7. EMSAs summarising binding of Cas8' (0-500 nM) binding to nuclease substrates (1 nM each) that each contain a 3' ended single stranded DNA or RNA region as indicated. Magnesium was absent from reactions to prevent Cas8' nucleolysis. (i) DNA-DNA flap, (ii) RNA-DNA hybrid flap and (iii) RNA-RNA flap. Oligonucleotide sequences are given in supplementary methods. In each case the ³²P labelled strand is marked by *. Panel iv summarises that Cas8' has no detectable nuclease on an RNA-RNA substrate, in contrast to RNA-DNA or DNA-DNA of the same nucleotide sequence.

Figure S8. (A). Urea denaturing gels (15% acrylamide) summarising nuclease activities of Cas8' and mutants on 3' ssRNA in an RNA-DNA hybrid (1 nM). In each case the RNA strand (crRNA1) was ³²P end-labelled (indicated) to detect cleavage on urea gel after mixing with protein at final concentrations of 0, 50, 100, 200, 400, 600, 800 and 1000 nM. (B). Graph summarising binding of catalytically inactive Cas8' to a nuclease substrate (1 nM). EMSAs measuring binding as shown were in duplicate, plotted as means of % substrate bound and showing bars for standard error.

Figure S9. Northern blot showing that crRNA processing in *Haloferox* is unaffected by deletion of Cas8. Cells with Cas8 deleted (del8) continue to generate crRNA like wild type (wt) cells, and this effect is not influenced by expression of Cas8 from an inducible plasmid in del8 cells (del8 +).
