Supplementary Figure 1 Analysis of antioxidant ability

LDL obtained from pooled serum was incubated with copper sulfate in the presence and the absence of rhSAA. The figure shows a representative oxidation curve obtained by monitoring of the constructed conjugated diene at 234 nm at 10 min intervals. The lag time and the maximum velocity (V_{max}) are defined as the intersection of the lag phase and the propagation phase lines and as the slope ($\Delta\text{ABS}/\text{min}$) of the propagation phase line, respectively.
