#### Abbreviations:

Fms1, yeast polyamine oxidase; MeSpd, 1-methylspermidine (1,8-diamino-5-azanonane); Me<sub>2</sub>Spm, 1,12-dimethylspermine (2,13-Diamino-5,10-diazatetradecane); N<sup>1</sup>-Ac-MeSpd, N<sup>8</sup>-Acetyl-1,8-diamino-5-azanonane.

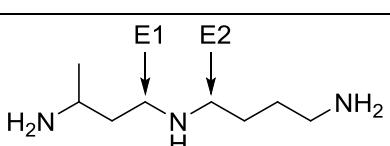

#### Supplementary Table 1. N<sup>1</sup>-AcSpd and N<sup>1</sup>-Acetylated MeSpd as substrates of Fms1.

The reactions were carried out in triplicate at pH 9.0 in 100 mM Glycine-NaOH at +25°C. Kinetic values for N<sup>1</sup>-Ac-MeSpd enantiomers were determined by using substrate concentrations of 25, 50, 100, 200, 400, 600 and 1000 μM. Recombinant Fms1 was 1.8 μg/reaction and the incubation times for Rac-MeSpd 30 min, (R)-MeSpd 20 min and (S)-MeSpd 40 minutes. Linearity of reaction was monitored by using T<sub>1/2</sub> controls, i.e. samples that have been incubated for 15, 10 and 20 min, respectively (half of the reaction time of an ordinary sample). Put formation was monitored by using HPLC. k<sub>cat</sub> values have been calculated assuming M<sub>r</sub> of 58,833 for monomer with one catalytically active centre.

Polyamine	K <sub>m</sub> (μM)	V <sub>max</sub> (nmol/min/mg)	k <sub>cat</sub> s <sup>-1</sup>	k <sub>cat</sub> /K <sub>m</sub> M <sup>-1</sup> s <sup>-1</sup>

**Supplementary Table 2 Enantiomers of MeSpd as substrates of Fms1.**

The reactions were carried out in triplicate at pH 9.0 in 100 mM Glycine-NaOH at +25°C. Kinetic values for MeSpd enantiomers were determined by using substrate concentrations of 100, 300, 600, 1000, 2000 and 4000 µM. Recombinant Fms1 was 3.8 µg/reaction and the incubation time 60 minutes. Linearity of reaction was monitored by using T<sub>1/2</sub> controls, i.e. samples that have been incubated for 30 min (half of the reaction time of an ordinary sample). E<sub>1</sub> cleavage was monitored by HPLC by measuring Put formation and E<sub>2</sub> cleavage by determining butane-1,3-diamine content. k<sub>cat</sub> values have been calculated assuming M<sub>r</sub> of 58,833 for monomer with one catalytically active centre.

		E <sub>1</sub> cleavage kinetic values			E <sub>2</sub> cleavage kinetic values

**Supplementary Table 3 The effects of increasing aromatic aldehyde concentration for the regioselectivity of Fms1 using (R)-MeSpd or (S)-MeSpd as a substrate.**

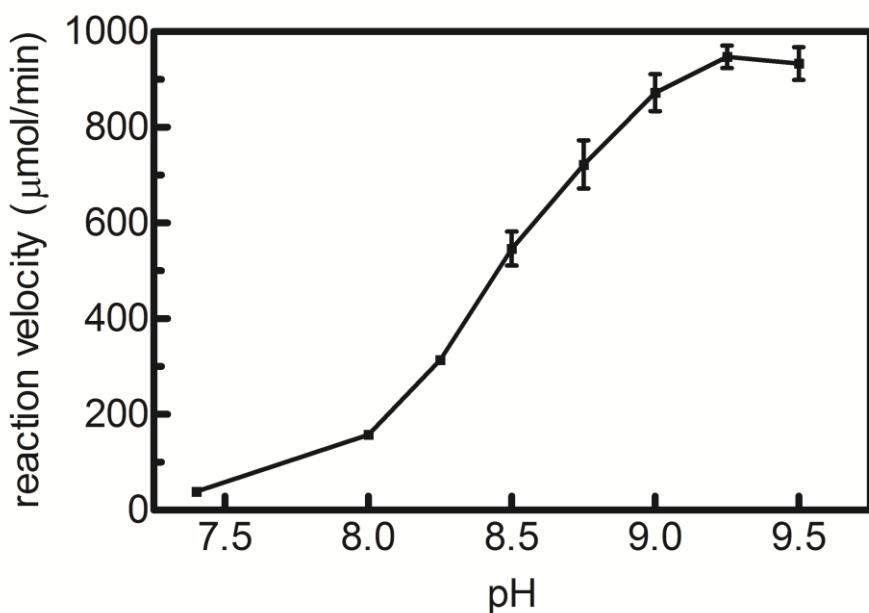

The reactions were carried out in triplicate at pH 9.0 in 100 mM Glycine-NaOH at +25°C with the fixed 1 or 4 mM MeSpd supplemented with increasing concentration 50 or 500 µM of tested aldehyde. Recombinant Fms1 was 1.6 µg/reaction and the incubation time from 15 to 30 minutes. Linearity of reaction was monitored by using T<sub>1/2</sub> controls, i.e. samples that have been incubated for 7.5 to 15 min (half of the reaction time of an ordinary sample). E<sub>1</sub> cleavage was monitored by HPLC by measuring Put formation and E<sub>2</sub> cleavage by determining butane-1,3-diamine content.

Supplementary Figure 1

**Catalytic velocities of Fms1 with 1 mM Spm as a substrate in 170 mM Bis-Tris buffer at different pH**

200 mM (170 mM in the final reaction mixtures) Bis-Tris propane buffer was prepared at pH 7.4; 8.0; 8.5; 8.8; 9.0; 9.2 and 9.5. Fms1 0.1  $\mu$ g/reaction mixture was supplemented with 1 mM Spm at various pH  $V_{tot}$  180  $\mu$ l. Reaction mixtures were incubated at 25 °C water bath for four minutes until 20  $\mu$ l of 50 % w/v SSA containing 100 uM DAH was added and vortexed briefly and placed on ice. HPLC was used to analyse Spd content of samples as described in Experimental Procedures. Values are averages of triplicate determinations expressed as  $\mu$ mol/min  $\pm$  SD (error bars).
