

Supplement

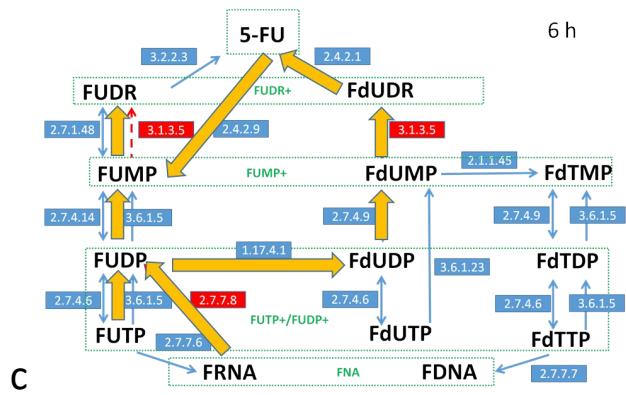

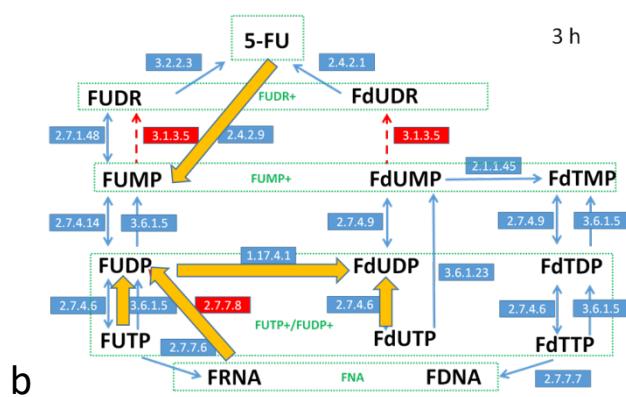

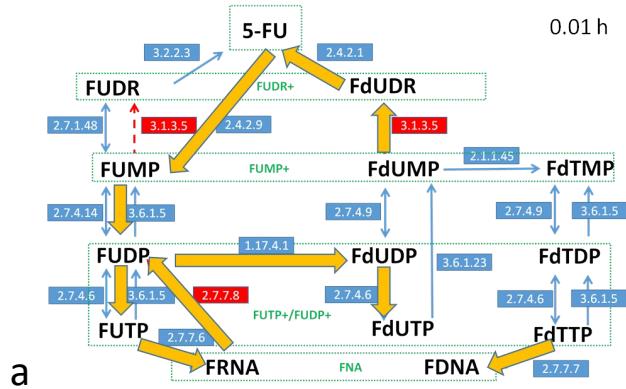

Supp. Fig.1. *S. cerevisiae* growth. The growth was monitored at 5-FU concentration varying in the range of 10mM - 0.1μM (from top-left to bottom-right, respectively).

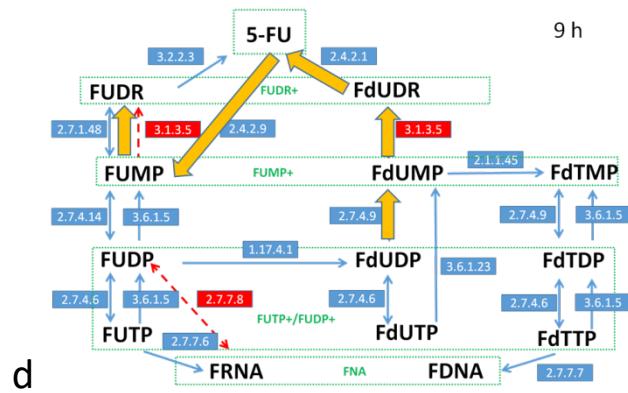

Supp. Fig.2. The quality of fit. Predicted vs observed values, a summary plot for all estimated parameters in an appropriate assumed units. A group of the kinetic rate separates from the concentration related parameters.

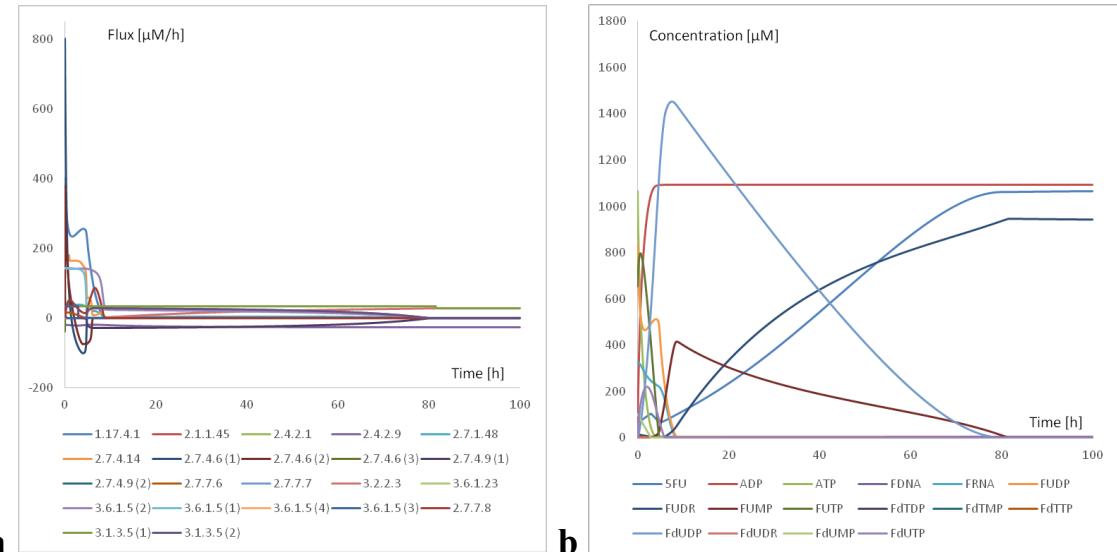

Supp. Fig.3. Theoretical predictions of fitted model (time <=17 h). Kinetics of changes during the experiment, in: a- flux, b- concentration of species.

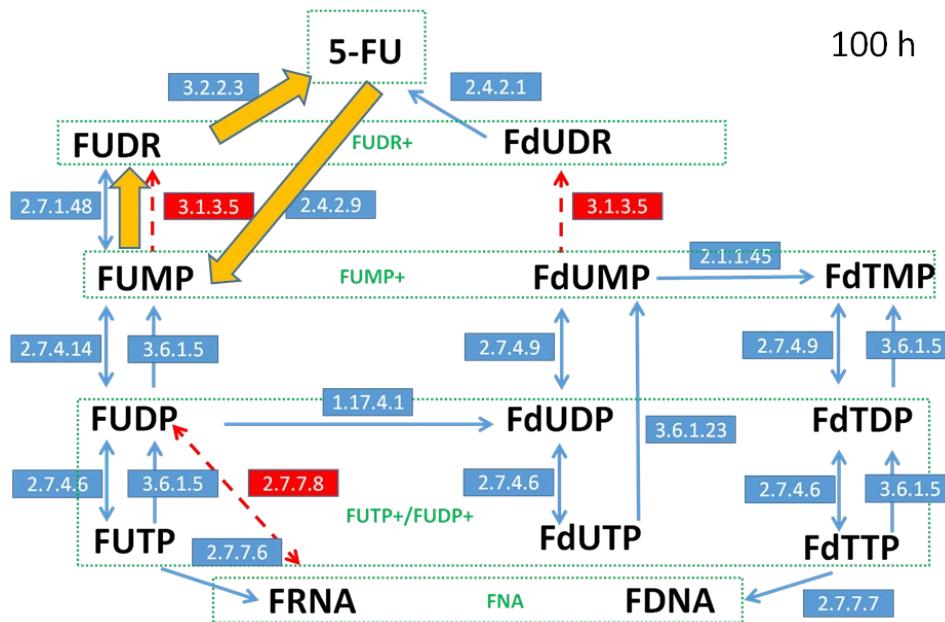

Supp. Fig.4. The main metabolic routes during experiment. The orange arrows indicate the dominating flux predicted by the fitted model, for the different time of the experiment: a - 0.01h, b- 3 h, c- 6 h, and d- 9 h.

Supp. Fig.5. Theoretical predictions of fitted model (9h < time <=100h). Kinetics of changes, in: a- flux, b-concentration of species.

Supp. Fig.6.The main metabolic routes beyond the experiment. The orange arrows indicate the dominating flux predicted by the fitted model, time = 100 h.

Supp. Tab.1. Metabolite initial concentration [μM]
