Genes that are upregulated in MFB were selected according to the following criteria: (1) five-fold greater than in steady-state FB; (2) five-fold greater than in total lung homogenates; and (3) two-fold greater than the mean value of all genes in MFB. Conversely, genes upregulated in steady-state FB were defined according to the following criteria: (1) five-fold greater than in MFB; (2) five-fold greater than in total lung homogenates; and (3) two-fold greater than the mean value of all genes in steady-state FB. The listed genes are available in the NCBI Reference Sequence.

## Supplementary figure legends

**Figure S1.** Heatmap of gene expression profiles in each sample

This heatmap is generated using a list of the top 1,000 genes with a large signal gap among all samples (myofibroblasts [MFB], steady-state fibroblasts [FB], and controls). Lung homogenates are used as controls.

**Figure S2.** Immunofluorescence images of fibrotic lesions, including fibroblastic foci, in a biopsied lung of idiopathic pulmonary fibrosis

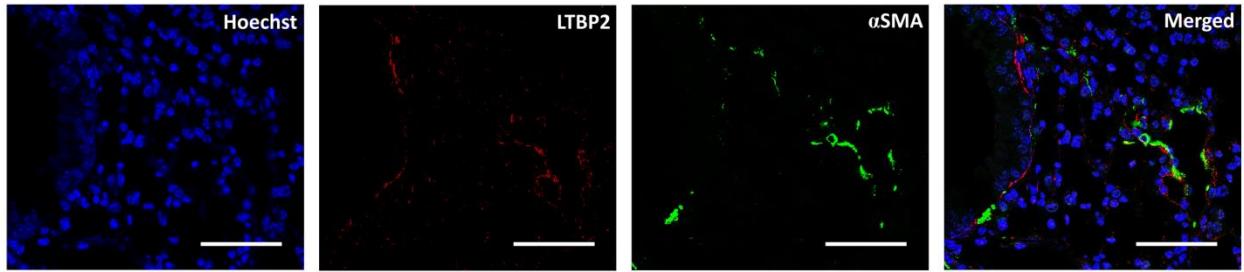

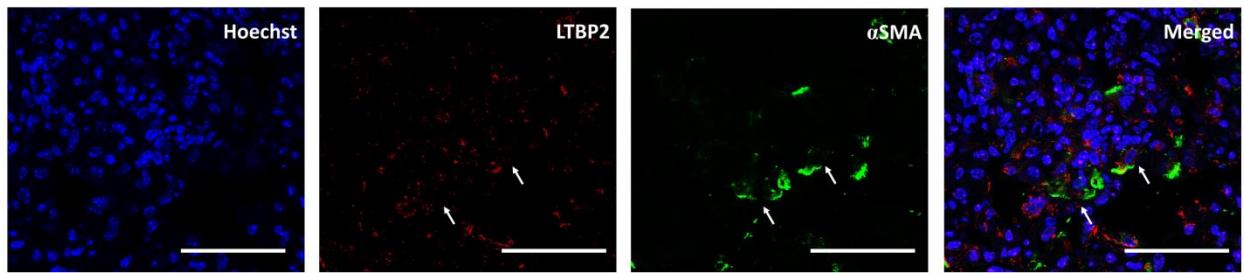

A. Anti-latent transforming growth factor- $\beta$  binding protein-2 (LTBP2) and anti- $\alpha$ -smooth

muscle actin ( $\alpha$ SMA) staining. LTBP2 is broadly upregulated in the fibrotic interstitium but was scarce in the  $\alpha$ SMA-positive fibroblastic focus (arrow).

**B.** Anti-LTBP2 and anti-elastin staining. The positivity of LTBP2 and elastin was partially overlapping (triangles). The fibroblastic focus (arrow) did not show apparent positivity for both proteins.

**C.** Anti-LTBP2 and anti-fibrillin-1 staining. Similar to elastin, the positivity of fibrillin-1 was also partially overlapping with LTBP2 (triangles). The fibroblastic focus (arrow) did not show apparent positivity for both proteins.

All scale bars = 20  $\mu$ m.

**A****B**

**Figure S3.** Immunofluorescence images of mouse lungs

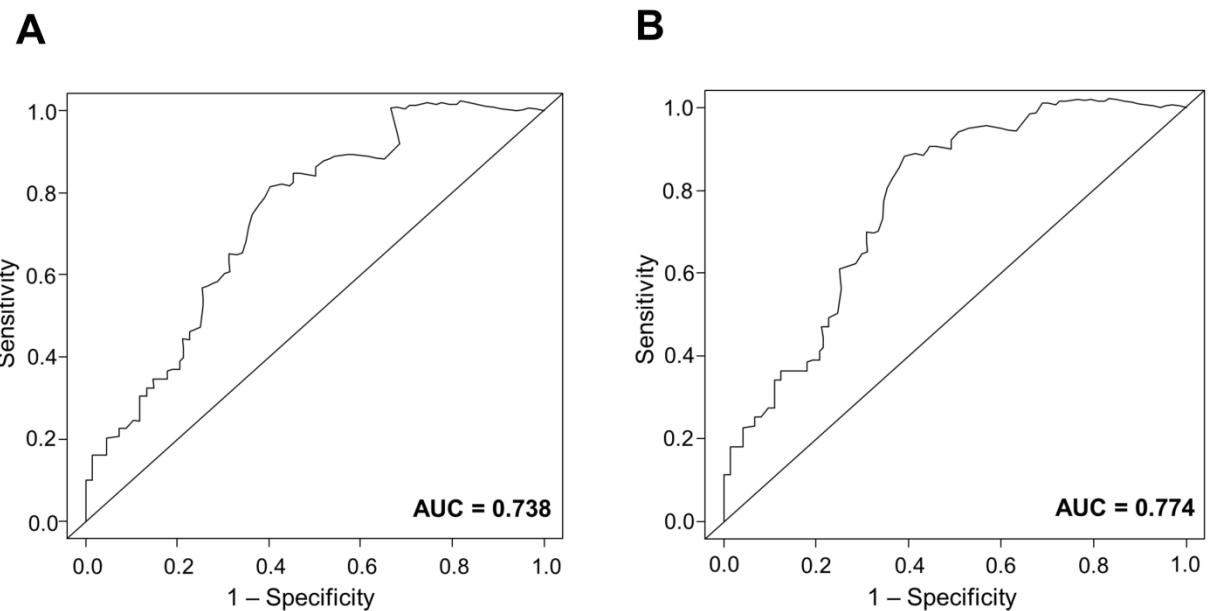

**A** (Untreated mouse lung). Latent transforming growth factor- $\beta$  binding protein-2 (LTBP2) and

$\alpha$ -smooth muscle actin ( $\alpha$ SMA) were observed only around the bronchiole and the blood vessel.

**B** (Bleomycin-treated mouse lung). LTBP2 positivity was increased in the interstitium mainly as

an extracellular matrix protein. Some of the proteins colocalized with  $\alpha$ SMA-positive myofibroblasts (arrows).

All scale bars = 50  $\mu$ m.

**Figure S4.** Receiver operating characteristic curves for serum latent transforming growth factor- $\beta$  binding protein-2 concentrations (evaluated at the time of diagnosis of idiopathic pulmonary fibrosis) during the 60-month follow-up

- A.** The endpoint was set at all-cause death.
- B.** The endpoint was set at death by respiratory events.
