1. POLICY OF THE JOURNAL

1.1. Scope

*Clinical Science* publishes papers in the field of clinical investigation, provided they are of a suitable standard and contribute to the advancement of knowledge in this field. The term ‘clinical investigation’ is used in its broad sense to include studies in animals and the whole range of biochemical, physiological, immunological and other approaches that may have relevance to disease in man. Studies which are confined to normal subjects, or animals, or are purely methodological in nature may be acceptable. The material presented should permit conclusions to be drawn and should not be only of a preliminary nature. The journal publishes four types of manuscript, namely invited Editorial Reviews, Full Papers, Short Communications and Correspondence. In addition, *Clinical Science* publishes abstracts of the proceedings of the Medical Research Society and also that Society’s Annual Guest Lecture.

1.2. The Editorial Board

The Board comprises Editors for the Medical Research Society and the Biochemical Society and a Chairman and Deputy Chairman who are drawn alternately from the two Societies. Members of the Board retire after a maximum of 5 years; the Chairman serves in his capacity for 2 years. The membership of the Board is designed to cover as wide a range of interests as possible.

The main function of the Board is to decide on the acceptability of submitted papers, but it also deals with general matters of editorial policy. Financial policy is dealt with separately by the Committee of Management.

1.3. The editorial process

A submitted paper is first read by the Chairman of the Editorial Board who then sends it to an Editor. The latter considers the paper in detail and sends it to one or more referees (who remain anonymous) from outside the membership of the Board. The Editor returns it with his recommendation to the Chairman who then writes formally to the authors. The ultimate responsibility of acceptance for publication lies with the Chairman. If the
Chairman is for any reason unavailable, the Deputy Chairman assumes this function.

1.4. Ethics of investigations on human subjects

Authors must state in the text of their paper the manner in which they have complied, where necessary, with the recommendations on human investigations published in the Medical Research Council report of 1962/63 (British Medical Journal (1964) ii, 178–180). Consent must be obtained from each patient or subject after full explanation of the purpose, nature and risks of all procedures used and the fact that such consent has been given should be recorded in the paper. Papers should also state that the Ethical Committee of the Institution in which the work was performed has given approval to the protocol. The Editorial Board will not accept papers the ethical aspects of which are, in the Board’s opinion, open to doubt.

1.5. Originality of papers

Submission of a paper to the Editorial Board is taken to imply that it reports work that has not been published in either the same or a substantially similar form, that it is not under consideration for publication elsewhere and that, if accepted for publication by Clinical Science, it will not be published elsewhere in the same form, either in English or in any other language, without the consent of the Editorial Board. This does not usually apply to previous publication of oral communications in brief abstract form. In such cases authors should enclose copies of the abstracts. The author, or in the case of multiple authorship the authors, will be asked to sign a statement vesting the copyright in the publishers. Requests for consent for reproduction of material published in Clinical Science should be addressed to the Editorial Manager.

2. SUBMISSION OF MANUSCRIPTS:
GENERAL INFORMATION
AND FORMAT

2.1. General

Papers submitted for publication should be sent to the Editorial Manager, Clinical Science, 7 Warwick Court, London WC1R 5DP.

The submission should contain four copies (of which three may be photocopies) of the typescript, Tables, Figures etc. The authors should retain one copy of the paper. The Editorial Board does not accept responsibility for damage or loss of papers submitted, although great care is taken to ensure safety and confidentiality of the typescript during the editorial process. In the case of multiple authorship, the covering letter should indicate that the approval of all co-authors has been obtained.

Papers should be presented so that they are intelligible to the non-specialist reader of the journal. This is particularly important in highly specialized fields and a very brief résumé of the current state of knowledge is usually helpful. Certain types of material, e.g. mathematical formulations requiring more than trivial derivations, should be given in a separate Appendix.

Where the reader is referred to previous works by the same author(s) for important details relevant to the present work, copies or reprints of the publication should be sent with the typescript. This is of particular importance in relation to methodology.

The dates of receipt and acceptance of the paper will be published. If the paper has to be returned to the authors for revision and is not resubmitted within 1 month, the date of receipt will be revised accordingly. Papers returned by authors later than 12 months after the original submission date will be treated as new papers. For Short Communications the published date will always be that of receipt of the final version. It is emphasized that badly presented or unduly long papers will be returned for revision and delays in publication will be inevitable. Similar delays will be incurred if the typescript is not prepared strictly in accordance with the instructions detailed below.

2.2. Full papers

The authors should refer to a current issue of Clinical Science to make themselves familiar with the general layout. Concise presentation is very important for rising costs are a severe constraint on space. The length of manuscript and the number of Figures and Tables must be kept to a minimum. Extensive Tables of data can be deposited with the Royal Society of Medicine (see 2.5). Guidance for Authors is usually published in the January issue of the journal, and revised periodically.

Typescripts should be, in general, arranged as follows:

(a) Title page. Title: this should be as informative as possible, since titles of papers are being increasingly used in indexing and coding for information storage and retrieval. The title should indicate the species in which the observations reported have been made. The numbering of parts in a series of papers is not permitted.

List of authors’ names (degrees and appointments are not required).
Guidance for Authors

Laboratory or Institute of origin.

Key words: for indexing the subject of the paper; they should, if possible, be selected from the current issues of 'Medical Subject Headings' (MeSH), produced by the Index Medicus.

Short title: for use as a running heading in the printed text; it should not exceed forty-five characters and spaces.

Author for correspondence: the name and address of the author to whom queries and requests for reprints should be sent.

(b) Summary. This should be a brief statement arranged in numbered paragraphs of what was done, what was found and what was concluded and should rarely exceed 250 words. Contributors from non-English speaking countries are invited to include a translation of the summary in their own language. Abbreviations should be avoided as far as possible and must be defined. Statistical and methodological details including exact doses should also be avoided unless they are essential to the understanding of the summary.

(c) Introduction. This should contain a clear statement of the reason for doing the work, but should not include either the findings or the conclusions.

(d) Methods. The aim should be to give sufficient information in the text or by reference to permit the work to be repeated without the need to communicate with the author.

(e) Results. This section should not include material appropriate to the Discussion section.

(f) Discussion. This should not contain results and should be pertinent to the data presented.

(g) Acknowledgments. These should be as brief as possible.

(h) References. See p. v for the correct format.

(i) Figures and Tables. See p. iv.

2.3. Short Communications

The Short Communication should describe completed work, and should not be merely a preliminary communication. The format of Short Communications should be similar to that of Full Papers, but should not exceed 1200 words of text. One Figure or Table is allowed, but if neither is included the text may be expanded to 1400 words. The passage of Short Communications through the editorial process can frequently be expedited and contributors are encouraged to take advantage of these facilities when rapid publication is of importance and the material can be presented concisely. The paper should appear in print within 3 months of acceptance. When submitting Short Communications, authors should make it quite clear that the work is intended to be treated as a Short Communication.

2.4. Correspondence

Letters containing critical assessments of material published in Clinical Science, including Editorial Reviews, will be considered for the Correspondence section of the journal. Letters should be no longer than 750 words, with one Figure or Table and up to six references, or 1000 words maximum without a Figure or Table. Such letters should be sent to the Editorial Manager, Clinical Science, within 6 months of the appearance of the article concerned. They will be sent to the authors for comment and both the letter and any reply by the author will be published together. Further correspondence arising therefrom will also be considered for publication. Consideration will also be given to publication of letters on ethical matters. Work submitted as a full paper or Short Communication that is assessed by the Editorial Board as unacceptable in that form might be acceptable for publication as a letter.

2.5. Arrangements for large amounts of information

It is impracticable to publish very large sets of individual values or very large numbers of diagrams, and under these circumstances a summary of the information only should be included in the paper. The information from which the summary was derived should be submitted with the typescript and, if the latter is accepted, the Editors may ask for a copy of the full information and diagrams to be deposited with the Librarian, the Royal Society of Medicine, 1 Wimpole Street, London W1M 8AE, who will issue copies on request. Experience has shown that such requests are frequently received.

2.6. Proof corrections

These are expensive and corrections of other than printers' errors may have to be charged to the author.

2.7. Offprints

Fifty offprints are supplied free and additional copies may be obtained at terms, based upon the cost of production, that will be given with the proofs. All offprints should be ordered when the proofs are returned.

2.8. Availability on MEDLINE

Summaries of papers in Clinical Science are available on-line on teleprinters participating in the
Guidance for Authors

3. MISCELLANEOUS NOTES

3.1. Abbreviations

Abbreviations should be avoided; if used they must be defined at the first mention; new abbreviations should be coined only for unwieldy names which occur frequently. Abbreviations should not appear in the title nor, if possible, in the Summary. A list of accepted abbreviations is on p. vi. Numbers, not initials, should be used for patients and subjects.

3.2. Anatomical nomenclature

This should follow the recommendations of the International Anatomical Nomenclature Committee (1966) Nomina Anatomica, 3rd edn, Excerpta Medica Foundation, Amsterdam.

3.3. Animals, plants and micro-organisms

The full binomial specific names should be given at first mention for all experimental animals other than common laboratory animals. The strain and, if possible, the source of laboratory animals should be stated. Thereafter in the text, single letter abbreviations may be given for the genus; if two genera with the same initial letter are studied, abbreviations such as \textit{Staph.} and \textit{Strep.} should be used.

3.4. Buffers and salts

The acidic and basic components should be given, together with the pH. Alternatively, a reference to the composition of the buffer should be given. Further details are provided in the Biochemical Journal (1978) 169, 9.

When describing solutions containing organic anions and their parent acids, the salt designator (e.g. lactate, urate, oxalate) should be used in preference to the name of the acid (lactic, uric, oxalic) unless it is certain that virtually all of the acid is in the undissociated form.

The composition of incubation media should be described, or a reference to the composition should be given.

3.5. Computer modelling

Papers concerned primarily with computer modelling techniques are acceptable provided that use of such techniques leads to a clear choice between two or more alternative hypotheses, or to the formulation of a new hypothesis amenable to experimental challenge or verification, or provides some new insight into the behaviour of a particular physiological system. Extensive technical details of hardware and software should not be given.

3.6. Doses

Doses of drugs should be expressed in mass terms, e.g. milligrams (mg) or grams (g), and also (in parentheses) in molar terms, e.g. mmol, mol, where this appears to be relevant. Molecular weights of many drugs may be found in The Merck Index, 8th edn, Merck and Co. Inc., N.J., U.S.A.

3.7. Enzymes

Nomenclature should follow that given in Enzyme Nomenclature (1978), Academic Press, London and New York, and Enzyme Commission (EC) number should be quoted at the first mention. Where an enzyme has a commonly used informal name, this may be employed after the first formal identification. A unit of enzyme activity should preferably be expressed as that amount of material which will catalyse transformation of 1 \textmu mol of the substrate/min under defined conditions, including temperature and pH. Alternatively, or when the natural substrate has not been fully defined, activity should be expressed in terms of units of activity relative to that of a recognized reference preparation, assayed under identical conditions. Activities of enzymes should normally be expressed as units/ml or units/mg of protein.

3.8. Evaluation of measurement procedures

When a new measuring procedure has been used, or when an established procedure has been applied in a novel fashion, an estimate of the precision of the procedure should be given. This should, as far as possible, indicate what sources of variation have been included in this estimate, e.g. variation of immediate replication, variation within different times of day, or from day to day etc.

If the precision of measurement varies in proportion to the magnitude of the values obtained, it can best be expressed as the coefficient of variation; otherwise it should be expressed by an estimate of the (constant) standard error of a single observation, or by estimates at several points within the range of observed values.

When recovery experiments are described the approximate ratio of the amount added to the amount already present and the stage of the procedure at which the addition was made should be stated.

3.9. Figures and Tables

These are expensive to print and their number should be kept to a minimum. Their appropriate
position in the paper should be indicated in the margin of the text. References to Figures and Tables should be in Arabic numerals, e.g. Fig. 3, and they should be numbered in order of appearance. In general, the same data should not be presented in both a Figure and a Table.

Figures, with captions attached, should be supplied as original drawings or matt photographs together with photocopies. All Figures should have their number and the authors’ names written in pencil on the back; the top of the Figure should be indicated with a pencilled arrow. Acceptable symbols for experimental points are ○, △, ■, □, ▽, □. The symbols × or + must be avoided. The same symbols must not be used for two curves where the points might be confused. For scatter diagrams, solid symbols are preferred. When a particular variable appears in more than one Figure, the same symbol should be used for it throughout, if possible.

Curves should not be drawn beyond the experimental points, nor should axes extend appreciably beyond the data. Only essential information that cannot readily be included in the legend should be written within the Figure.

Figures for half-tone reproduction should be submitted as glossy prints. They are particularly expensive to print and their use should be avoided as far as possible.

Tables should be typed separately from the text. They should have an underlined title followed by any legend. Captions for the Figures, and titles and legends for the Tables, should make them readily understandable without reference to the text. Adequate statistical information, including that on regression lines, should be included in Figure captions where appropriate.

3.10. Footnotes
These should be avoided as far as possible but where they are used in Tables they should be identified by the symbols * † ‡ § ¶, in that order.

3.11. Isotope measurements
The information given should include (a) conditions of radioactivity counting, e.g. infinitely thick, infinitely thin; (b) the nature of the phosphor used in liquid-scintillation counting; (c) details of corrections made to the observed count rate, e.g. for ‘quenching’ or ‘cross-over’; (d) standard deviation of the results or a statement of the minimum total counts above background collected and the background value.

In general the specific radioactivity of the starting materials should be given, preferably in terms of radioactivity per unit weight or, for stable isotopes, as atoms % excess.

Pending the general introduction of SI units radioactivity should continue to be expressed in terms of the curie (Ci) followed by the corresponding figure in terms of the becquerel (Bq: disintegrations/s), in parentheses, and suitably rounded.

3.12. Radionuclide applications in man
If new or modified radionuclide applications in man are described, an estimate of the maximal possible radiation dose to the body and critical organs should be given.

For the time being this can continue to be expressed in rems, but with the corresponding figure in sieverts (Sv) given in parentheses after it.

3.13. Methods
In describing certain techniques, namely centrifugation (when the conditions are critical), chromatography and electrophoresis, authors should follow the recommendations published by the Biochemical Society (currently, Biochemical Journal (1981) 193, 1–21).

This should follow the International Classification of Disease (8th revision, World Health Organization, Geneva, 1969) as far as possible.

3.15. Powers in Tables and Figures
Care is needed where powers are used in Table headings and in Figures to avoid numbers with an inconvenient number of digits. For example: (i) an entry ‘2’ under the heading $10^2k$ means that the value of $k$ is 0.002; an entry ‘2’ under the heading $10^{-2}k$ means that the value of $k$ is 2000. (ii) A concentration 0-00015 mol/l may be expressed as 0.15 under the heading ‘concn. (mmol/l)’ or as 150 under the heading ‘concn. (µmol/l)’ or as 15 under the heading ‘$10^2$ x concn. (mol/l)’, but not as 15 under the heading ‘concn. (mol/l $\times 10^{-2}$)’.

3.16. References
The numerical citation system is now used: references in the text are numbered consecutively in the order in which they are first mentioned, the numerals being given in brackets, e.g. [22]. References cited in Figure legends or Tables only should be numbered in a sequence determined by the position of the first mention in the text of the Figure or Table. References should be listed in
numerical order and the names of all authors of a paper should be given, with the full title of the paper and the source details in full including the first and last page numbers, e.g.

When the quotation is from a book, the following format should be used, giving the relevant page or chapter number:

References to 'personal communications' and 'unpublished work' should appear in the text only and not in the list of references. The name and initials of the source of information should be given. When the reference is to material that has been accepted for publication but has not yet been published, this should be indicated in the list of references by 'In press' together with the name of the relevant journal and, if possible, the expected date of publication. If such a citation is of major relevance to the manuscript submitted for publication authors are advised that the editorial process might be expedited by the inclusion of a copy of such work. In the case of quotations from personal communications the authors should state in the covering letter that permission for quotation has been obtained.

3.17. Solutions
Concentration of solutions should be described where possible in molar terms (mol/l and subunits thereof), stating the molecular particle weight if necessary. Values should not be expressed in terms of normality or equivalents. Mass concentration should be expressed as g/l or subunits thereof, for example mg/l or µg/l. For solutions of salts, molar concentration is always preferred to avoid ambiguity as to whether anhydrous or hydrated compounds are used. Concentrations of aqueous solutions should be given as mol/l or mol/kg (g/l or g/kg if not expressed in molar terms) rather than % (w/v) or % (w/w). It should always be made clear whether concentrations of components in a reaction mixture are final concentrations or the concentrations in solutions added.

3.18. Spectrophotometric data
The term 'absorbance' [log (I/F) should be used rather than 'optical density' or 'extinction'. The solvent, if other than water, should be specified. Symbols used are: A, absorbance; a, specific absorbance coefficient (litre g⁻¹ cm⁻¹) (alternatively use A₁cm⁻¹); ε, molar absorption coefficient (the absorbance of a molar solution in a 1 cm light-path) (litre mol⁻¹ cm⁻¹, not cm² mol⁻¹).

3.19. Spelling

3.20. Statistics
Papers are frequently returned for revision (and their publication consequently delayed) because the authors use inappropriate statistical methods. Two common errors are the use of means, standard deviations and standard errors in the description and interpretation of grossly non-normally distributed data and the application of t-tests for the significance of difference between means in similar circumstances, or when the variances of the two groups are non-homogeneous. In some circumstances it may be more appropriate to provide a 'scattergram' than a statistical summary.

A reference should be given for all methods used to assess the probability of a result being due to chance. The format for expressing mean values and standard deviations or standard errors of the mean is, for example: mean cardiac output 10.4 l/min (SD 1.2; n = 11). Degrees of freedom should be indicated where appropriate. Levels of significance are expressed in the form P < 0.01.

3.21. Trade names
The name and address of the supplier of special apparatus and of biochemicals should be given. In the case of drugs, approved names should always be given with trade names and manufacturers in parentheses.

4. UNITS: THE SI SYSTEM
The recommended Système International (SI) units [see Quantities, Units and Symbols, 2nd edn (1975) The Royal Society, London] are used by Clinical Science. All papers submitted should use these units except for blood pressure values, which should be expressed in mmHg, or gas tensions, where values at the author's discretion may be given as mmHg (with kPa in parentheses) or as kPa (with mmHg in parentheses) in the text and either as mmHg or as kPa in Figures, which (if practicable) should have scales in both units. Airways pressure should be expressed in kPa. Where molecular weight is known, the amount of a chemical or drug should be expressed in mol or in
an appropriate subunit, e.g. mmol. Energy should
be expressed in joules (J).

The basic SI units and their symbols are as follows:

<table>
<thead>
<tr>
<th>Physical quantity</th>
<th>Name</th>
<th>Symbol</th>
</tr>
</thead>
<tbody>
<tr>
<td>length</td>
<td>metre</td>
<td>m</td>
</tr>
<tr>
<td>mass</td>
<td>kilogram</td>
<td>kg</td>
</tr>
<tr>
<td>time</td>
<td>second</td>
<td>s</td>
</tr>
<tr>
<td>electric current</td>
<td>ampere</td>
<td>A</td>
</tr>
<tr>
<td>thermodynamic</td>
<td>kelvin</td>
<td>K</td>
</tr>
<tr>
<td>temperature</td>
<td>candelal</td>
<td>cd</td>
</tr>
<tr>
<td>amounts of substance</td>
<td>mole</td>
<td>mol</td>
</tr>
</tbody>
</table>

The following are examples of derived SI units:

<table>
<thead>
<tr>
<th>Physical quantity</th>
<th>Name</th>
<th>Symbol</th>
</tr>
</thead>
<tbody>
<tr>
<td>energy</td>
<td>joule</td>
<td>J</td>
</tr>
<tr>
<td>force</td>
<td>newton</td>
<td>N</td>
</tr>
<tr>
<td>power</td>
<td>watt</td>
<td>W</td>
</tr>
<tr>
<td>pressure</td>
<td>pascal</td>
<td>Pa</td>
</tr>
<tr>
<td>electric charge</td>
<td>coulomb</td>
<td>C</td>
</tr>
<tr>
<td>electric potential</td>
<td>volt</td>
<td>V</td>
</tr>
<tr>
<td>electric resistance</td>
<td>ohm</td>
<td>Ω</td>
</tr>
<tr>
<td>conductance</td>
<td>siemens</td>
<td>S</td>
</tr>
<tr>
<td>capacitance</td>
<td>farad</td>
<td>F</td>
</tr>
<tr>
<td>frequency</td>
<td>hertz</td>
<td>Hz</td>
</tr>
<tr>
<td>volume</td>
<td>litre</td>
<td>l</td>
</tr>
</tbody>
</table>

The word ‘litre’ has been accepted as a special
name for cubic decimetre (1 litre = 1 dm³).

Both the basic and derived SI units, including the
symbols of derived units that have special names,
may be preceded by prefixes to indicate multiples
and submultiples. The prefixes should be as follows:

<table>
<thead>
<tr>
<th>Prefix</th>
<th>Symbol</th>
<th>Multiple</th>
<th>Prefix</th>
<th>Symbol</th>
</tr>
</thead>
<tbody>
<tr>
<td>10⁶</td>
<td>mega</td>
<td>M</td>
<td>10⁻³</td>
<td>milli</td>
</tr>
<tr>
<td>10⁵</td>
<td>kilo</td>
<td>k</td>
<td>10⁻⁶</td>
<td>micro</td>
</tr>
<tr>
<td>10⁴</td>
<td>hecto</td>
<td>h</td>
<td>10⁻⁹</td>
<td>nano</td>
</tr>
<tr>
<td>10³</td>
<td>deka</td>
<td>da</td>
<td>10⁻¹²</td>
<td>pico</td>
</tr>
<tr>
<td>10⁻¹</td>
<td>deci</td>
<td>d</td>
<td>10⁻¹⁵</td>
<td>femto</td>
</tr>
<tr>
<td>10⁻²</td>
<td>centi</td>
<td>c</td>
<td>*</td>
<td></td>
</tr>
</tbody>
</table>

* To be avoided where possible (except for cm).

Compound prefixes should not be used, e.g. 10⁻² m
should be represented by 1 nm, not 1 mμm.

Notes:

(i) Full stops are not used after symbols.
(ii) Minutes (min), hours (h), days and years will
continue to be used in addition to the SI unit of
time (the second (s)).
(iii) The solidus may be used in a unit as long as
it does not have to be employed more than once,
e.g. mmol/l is acceptable, but ml/min/kg is not, and
should be replaced by ml min⁻¹ kg⁻¹.

5. ABBREVIATIONS, CONVENTIONS,
DEFINITIONS, SYMBOLS AND
SPECIAL COMMENTS

As well as standard symbols and abbreviations that
have been accepted by international bodies, and
which can be used without definition, this list shows
selected abbreviations in the form of groups of
capital letters (e.g. ALA, ECF, MCHC) which
when used must be defined in the text as indicated
on p. iv. The standard abbreviations for amino
acids are only for use in Figures and Tables or for
peptide sequences.

- GSH (reduced); GSSG (oxidized)
- Gty
- $g$
- $g$
- GH; if human, HGH
- Gy (100 rads)
- not allowed; use packed cell volume (PCV)
- Hb; express in g/dl
- $t_i$
- Hz
- His
- HCG
- HPL
- use cortisol
- aH; express in nmol/l
- pH
- 25-(OH)D₃
- Hyp
- IgA, IgD, IgE, IgG, IgM
Guidance for Authors

injection routes:
intra-arterial
intramuscular
intraperitoneal
intravenous
subcutaneous

international unit

injection routes: use abbreviations only in Figures

i.a.
i.m.
i.p.
i.v.
s.c.
i.u. (definition and reference should be given for uncommon or ambiguous applications, e.g. enzymes)

intracellular fluid
intracellular fluid volume
ionic strength
isoleucine
isotonic

isotopically labelled compounds

joule
kilogram(me)
kilopond

lactate dehydrogenase
leucine
leucocyte count
lipoproteins (serum)
high density
low density
very low density

litre

logarithm (base 10)
logarithm (base e)
luteinizing hormone
lysine
maximum
mean corpuscular
haemoglobin
mean corpuscular
haemoglobin concentration
mean corpuscular
haemoglobin volume

median lethal dose
metabolism
melting point
methanol, methanolic
methionine
metre
Michaels constant
micromole
micron (10^-6 m)
milliequivalent
millilitre
potential difference
power output
precipitate
pressure
probability of an event being
due to chance alone
proline
protein-bound iodine
(plasma)
pulmonary capillary blood
flow
pyrophosphate (inorganic)
rad (radiation dose; 10^-3 J
absorbed/g of material)
red blood cell
red cell mass
relative band speed (partition
chromatography)
renin
residual volume
resistance (rheological)
respiratory exchange
ratio (pulmonary)
respiratory quotient
(metadata)
revolutions
rev./min
ribonucleic acid
röntgen
saline
saturation
second (time)
serine
sievert
solvent systems
species
specific activity
specific conductance of
airways
standard deviation
standard error of the mean
standard temperature and
pressure
steroid nomenclature
sulphhydryl
sum
Svedberg unit
temperature (absolute)
temperature, thermodynamic
thin-layer chromatography
threonine
thyrotrophic hormone
thyrotrophin-releasing hor-
more
tidal volume
time (symbol)
time of day
torr
total lung capacity
tryptophan
 Tyvel
urinary concentration of x
valency
valine
variance ratio
vascular resistance
volt
volume of blood (in cardio
respiratory physiology)
watt
wavelength
weight
white blood cell
sGaw; express in
s^2 kPa^-1
may be used
without
definition
see Biochemical Journal
(1969) 113, 5-28;
(1972) 127, 613-617
use thiol or SH
use
use
factor
activity
not abbreviated
(100 rads = 1 Gy)
use erythrocyte;
express counts as
10^{12} cells/l
100 ergs/g \times quality
factor
see plasma renin
activity
RV
R; express in kPa l^-1 s
Tm,x
tidal volume
time (symbol)
time of day
torr
total lung capacity
tryptophan
tubular maximal reabsorptive
capacity for x
valence
total pressure
(1 torr = 0.133 kPa)
TLC
Trp
tor
U_x
e.g. Fe^{+++}, not Fe^{++}
Val
F
express in kPa l^-1 s (with
value in dyn s cm^-5
in parentheses);
primary values of dif-
ferential vascular pres-
ure (mmHg) and
flow (l/min) should
always also be given
in Tables or text as
appropriate
v; express as m s^-1
Q_{w}
used only for buffer mix-
tures; otherwise use
5,5'-diethylbarbituric
acid
\eta
\nu
\nuC
V
Q; use Q for blood flow
rate
W
\lambda
wt.
use leucocyte: express
counts as 10^8 cells/l

SUBJECT INDEX

First and last page numbers of papers to which entries refer are given. Page numbers marked with an asterisk refer to Editorial Reviews.

Absorption kinetics 617–626
Adenine nucleotides, dystrophic muscle 113–115
Adenosine 3':5'-cyclic monophosphate, vitamin D deficiency 381–387
Adenosine triphosphatase, Na+,K+-activated, erythrocyte sodium transport 489–494
Adrenalectomy, angiotensinogen 355–360
Adrenaline
  airway responses 349–354
  congestive heart failure 465–469
  noise stimulation 137–141
  β-Adrenoceptor blockade, diabetic subjects 131–136
  β-Adrenoceptors, asthma 349–354
Aerosol deposition, bronchial 13–16
Alanine
  kinetics and glucose 553–556
  obesity 77–81
Albuminuria, experimental 495–502
Alcohol, hypertension 1–6*
Aldosterone
  captopril 611–615
  congestive heart failure 465–469
  exercise 595–604
  potassium 373–380
  salt retention in bile-duct ligation 65–70
  sodium balance 373–380
Alkali secretion, gastric mucosa 343–348*
Alveolar gas, mixing efficiency 541–547, 549–551
Amino acids
  metabolism and α-oxoisocaprate 285–293
  undernutrition and sepsis 83–91
δ-[3,5-3H]Aminolaevulinic acid, bile pigment production 643–649
δ-Aminolaevulinic acid synthase, leucocyte 183–191
Ammonia
  glutamine 299–305
  hepatectomy 273–277
  α-oxoisocaprate 285–293
  urinary excretion 299–305
Ammoniagenesis, glutamine metabolism 299–305
Angina pectoris 119–123*
Angiotensin I
  angiotensinogen 355–360
  captopril and vasopressin release 341–342
  Angiotensin II
    aldosterone 373–380
    blood flow regulation 169–176
    captopril 341–342
    congestive heart failure 465–469
    intravascular coagulation 35–41
    kidney 35–41
    sympathetic reflexes 51–56
    vasopressin 143–149, 341–342
  Angiotensin antagonist ([Sar1,Ala8]angiotensin II) 51–56
  Angiotensinogen, direct radioimmunoassay 355–360
  Anorexia nervosa, behavioural thermoregulation 677–682
  Antidiuretic hormone, experimental congestive heart failure 465–469
  Apnoea, sleep and heart rate 163–167
  Apolipoprotein C-II, acquired deficiency 93–100
  Apolipoproteins 125–129*
  Aprotinin, Goldblatt hypertension 361–366
  Aspartate aminotransferase, heart isoenzymes 337–339
  Asphyxia, apnoeic, heart rate 163–167
  Asthma
    nocturnal 349–354
    plasma histamine and catecholamines 661–665
  Atherosclerosis, coronary 119–123*
  Atrophy, number of muscle fibres 227–234
  Atropine, alveolar gas mixing 549–551
  Autonomic nervous system
    blockade 57–64
    hypertension 581–588
  Autonomic neuropathy 561–562
  Baroreceptors
    borderline hypertension 307–309
    sensitivity 581–588
  Baroreflex sensitivity 581–588, 589–594
  Behaviour, thermoregulation 677–682
  N-Benzoyl-L-tyrosyl-p-aminobenzoic acid, intestinal non-pancreatic hydrolysis 557–560
  Bicarbonate secretion, duodenal taurocholate 651–659
  Bicarbonate, tubular absorption 667–676

3-Methylhistidine, liver cirrhosis 683–686
$\beta_2$-Microglobulin, plasma protein binding 403–410
Microspheres, renal blood flow 35–41
Mineralocorticoids, salt retention in bile-duct ligation 65–70
Mononuclear cells, low-density lipoprotein receptor activity 397–401
Motilin, bile salt 651–659
Mucociliary transport 13–16
Mucus–bicarbonate barrier 343–348*
Muscarinic cholinergic receptors, intestinal and pancreatic 203–207
Muscle chemistry, undernutrition and sepsis 83–91
Muscle fibres, knee injury 227–234
Muscular dystrophy, purine nucleotide profile 113–115
Myeloma, apolipoprotein C-II deficiency 93–100
Myocardial infarction 119–123*, 243–245
Myotonic dystrophy, abnormal bile acids 627–642
Nasal mucosa, mucociliary transport 13–16
Natriuresis, saralasin 573–579
Neck chamber 581–588
Needle biopsy, muscle 83–91
Negative pressure, lower body 51–56
Neostigmine, baroreflex responsiveness 581–588
Nephrotoxicity, bile acids 431–433
Neuromuscular disease, thoracoabdominal movements 7–11*
Neutron activation analysis, calcium 389–396
Nitrogen metabolism
-glutamine 299–305
-\alpha\text{-oxoisocaproate} 285–293
Nitrogen washout, alveolar gas mixing 541–547, 549–551
Noise, blood pressure and stress hormones 137–141
Noradrenaline
-congestive heart failure 465–469
-noise stimulation 137–141
-plasma kinetics 247–254*
-platet release 151–155
Nutrition, muscle intracellular amino acids 85–91
Obesity, fasting and alanine and 3-hydroxybutyrate 77–81
(+)-Octanoylcarnitine, hepatic deoxyribonucleic acid synthesis 295–297
Oedema
-congestive heart failure 465–469
-corticosterone 255–259*
diuretics and renal water excretion 235–238
exercise 595–604
Osteomalacia, secondary hyperparathyroidism 381–387
Osteoporosis
-bone mineral content 329–336
calcium balance and sex hormones 221–226
-parathyroid hormone 389–396
-\alpha\text{-Oxoisocaproate}, amino acid and nitrogen metabolism 285–293
PABA-peptide, intestinal non-pancreatic hydrolysis 557–560
Pancreas, muscarinic cholinergic receptors 203–207
Pancreatic elastase, acute pancreatitis 321–328
Pancreatic function
duodenal bile salt 651–659
PABA-peptide hydrolyase 557–560
Pancreatic polypeptide, bile salt 651–659
Pancreatitis, plasma elastase 321–328
Parasympathetic nervous system, small intestine and pancreas 203–207
Parathyroid hormone
-kidney and vitamin D deficiency 381–387
-osteoporosis 389–396
Peptides, intestinal absorption 617–626
-pH
-distal tubule 667–676
-hepatocyte lactate uptake 411–420
Phenylephrine, baroreceptor sensitivity 581–588
Phosphataemia, renal tubular absorption 503–508
Phosphate, X-linked hypophosphataemia 503–508
Photoreceptor dysfunction, chronic liver disease 109–111
Plasma membrane, lactate uptake 411–420
Plasma renin activity
-active renin 435–437
-hypertension 1–6*, 43–49
-intravascular coagulation 35–41
-renal failure 667–676
Plasma volume 43–49, 595–604
Platelets
-adhesiveness 239–242
-aggregation 177–181, 239–242
-noradrenaline in hypertension 151–155
Porphyria, haem biosynthesis and menstrual cycle 183–191

Posture
- heart rate 57–64
- subcutaneous blood flow 605–609

Potassium
- aldosterone 373–380
- excretion 471–477
- hypertension 1–6*, 117

Prolactin, noise stimulation 137–141

Propranolol
- baroreflex responsiveness 581–588
- diabetic subjects 131–136

Prostacyclin, platelet anti-aggregatory activity 177–181

Prostaglandin E, urinary excretion 27–33

Prostaglandins
- blood flow regulation 169–176
- captopril 611–615
- cytoprotection 343–348*
- dopamine excretion 209–213
- gastric mucosa 343–348*
- Goldblatt hypertension 361–366
- platelet aggregation 239–242

Proteins
- plasma 403–410
- muscle 683–686
- turnover 299–305, 403–410

Proteinuria, experimental 495–502

Pulmonary vascular resistance, cor pulmonale 255–259*

Purine nucleotides, muscular dystrophy 113–115

Radioimmunoassay
- angiotensinogen 355–360
- 1,25-dihydroxycholecalciferol 427–429

Receptors, lipoprotein, blood mononuclear cells 397–401

Renal failure
- acute 35–41
- chronic 479–488, 489–494

Renal tubules
- absorption 503–508, 667–676
- deiodination of thyroxine 215–220

Renin
- congestive heart failure 465–469
- dopamine 439–448*
- exercise 595–604
- inactive 435–437
- low-renin hypertension 1–6*
- renal molecular-weight conversion 157–162
- thrombin 35–41

Renin–angiotensin system
- intravascular coagulation 35–41
- sympathetic reflexes 51–56

Renin-binding substance, kidney 157–162

Rheumatoid arthritis, fibronectin 71–76

R–R interval, posture 57–64

Saralasin, renal function 573–579

Secretin, bile salt 651–659

Sepsis, muscle intracellular amino acids 83–91

Sex hormones, calcium balance in osteoporosis 221–226

Signal Detection Theory, breathing 367–372

Single breath test, alveolar gas mixing 541–547

Skin blood flow
- subatmospheric pressure 605–609

Sleep apnoea, heart rate 163–167

Sodium
- aldosterone 373–380
- balance 595–604
- bile-duct ligation 65–70
- dopamine 439–448*
- erythrocyte permeability 101–107
- hypertension 1–6*, 117
- hyponatraemia 235–238
- prostaglandins 27–33
- transport 489–494

Sodium chloride excretion
- blood volume expansion 457–464
- dietary sodium 471–477
- indomethacin 209–213
- prostaglandins 27–33

Sodium chloride loading
- hypernatraemia 471–477
- renal blood flow 35–41
- tubular function 667–676

Sodium taurocholate, duodenal perfusion 651–659

Sodium urate, calcium oxalate crystal growth 509–515

Spine, osteoporosis bone mineral 329–336

Spleen, blood flow 169–176

Stomach, mucosal protection 343–348*

Stress
- hypertension 1–6*
- noise 137–141

Stress hormones, noise stimulation 137–141

Subatmospheric pressure
- lower body 51–56
- skin blood flow 243–245

Substrate specificity, α-Liduronidase 193–201

Sulphydryl groups, molecular-weight conversion of renin 157–162

Sympathetic nervous system
- angiotensin 51–56
- assessment of function 247–254*
- noradrenaline plasma kinetics 247–254*
- vascular reflexes 51–56, 605–609

Synovial fluid, fibronectin 71–76
Tamm-Horsfall glycoprotein, urinary excretion 21–26
Tetraplegia, subcutaneous blood flow 605–609
Thermoregulation, anorexia nervosa 677–682
Thiol groups, molecular-weight conversion of renin 157–162
Thoracoabdominal movements, breathing 7–11*
Thyroxine, glucocorticoids and renal deiodination 215–220
Tidal volume, thoracoabdominal movements 7–11*
Tomography, cerebral blood flow 567–572*
Transport
erthyrocyte sodium 489–494
hepatocyte lactate uptake 411–420
plasma cholesterol 261–271*
polymorphonuclear leucocytes 563–564
renal 503–508
sodium 563–564
Transporters, hepatocyte lactate uptake 411–420
Triglyceride-rich lipoproteins, metabolism 125–129*
3,5,3'-Tri-iodothyronine, glucocorticoids and renal formation 215–220
Trypsin, bile salt 651–659
Twins, heritability of lipoprotein receptor activity 397–401
Ultrasonography, quadriceps femoris 227–234
Uraemia, oral 1,25-dihydroxycholecalciferol 427–429
Urate, urinary calcium oxalate 421–425, 509–514
Urea, kinetics and glucose 553–556
Uric acid, calcium oxalate crystal growth 509–514
Urine
albumin 495–502
calcium oxalate 17–19, 421–425, 509–514
crystal formation 17–19, 421–425
glycoprotein 21–26
macromolecules 509–514
oxalate 17–19, 421–425
Ursodeoxycholic acid, myotonic dystrophy 627–642

Vagotomy
breathing and exercise ability 311–319
muscarinic cholinergic receptors of intestine and pancreas 203–207
Vagus nerve, sleep apnoea and heart rate 163–167
Vascular resistance, renal 573–579
Vasoconstriction
captopril inhibition 565–566
posture in tetraplegia 605–609
sympathetic reflex 51–56
Vasopressin, angiotensin 143–149, 341–342
Veno-arteriolar reflex
myocardial infarction 243–245
posture in tetraplegia 605–609
Ventilation, distribution 549–551
Vitamin D deficiency, secondary hyperparathyroidism 381–387
Volume expansion, renal denervation 457–464
von Willebrand factor, physiological inhibition 239–242

Water, total body 43–49

Zinc deficiency, chronic liver disease 109–111
