### 1. POLICY OF THE JOURNAL

#### 1.1. *Scope*

*Clinical Science* publishes papers in the field of clinical investigation, provided they are of a suitable standard and contribute to the advancement of knowledge in this field. The term 'clinical investigation' is used in its broad sense to include studies in animals and the whole range of biochemical, physiological, immunological and other approaches that may have relevance to disease in man. Studies which are confined to normal subjects, or animals, or are purely methodological in nature may be acceptable. The material presented should permit conclusions to be drawn and should not be only of a preliminary nature. The journal publishes four types of manuscript, namely invited Editorial Reviews, Full Papers, Short Communications and Correspondence. In addition, *Clinical Science* publishes abstracts of the proceedings of the Medical Research Society (as Supplements) and also that Society's Annual Guest Lecture.

#### 1.2. *The Editorial Board*

The Board comprises Editors for the Medical Research Society and the Biochemical Society and a Chairman and two Deputy Chairmen who are drawn alternately from the two Societies. Members of the Board retire after a maximum of 5 years; the Chairman serves in his capacity for 2 years. The membership of the Board is designed to cover as wide a range of interests as possible.

The main function of the Board is to decide on the acceptability of submitted papers, but it also deals with general matters of editorial policy. Financial policy is dealt with separately by the Committee of Management.

#### 1.3. *The editorial process*

A submitted paper is first read by the Chairman or one of the Deputy Chairmen of the Editorial Board who then sends it to an Editor. The latter considers the paper in detail and sends it to one or more referees (who remain anonymous) from outside the membership of the Board. The Editor returns it with his recommendation to the Chairman who then writes formally to the authors. The ultimate responsibility of acceptance for publica-

tion lies with the Chairman. If the Chairman is for any reason unavailable, a Deputy Chairman assumes this function.

#### 1.4. *Ethics of investigations*

(a) Human subjects. Authors must state in the text of their paper the manner in which they have complied, where necessary, with the recommendations on human investigations published in the Medical Research Council report of 1962/63 [*British Medical Journal* (1964) ii, 178-180]. Consent **must** be obtained from each patient or subject after full explanation of the purpose, nature and risks of all procedures used and the fact that such consent has been given should be recorded in the paper. Papers should also state that the Ethical Committee of the Institution in which the work was performed has given approval to the protocol.

(b) Animals. Care must always be taken to ensure that experimental animals do not suffer unnecessarily. Authors must state in the text the anaesthetic procedures used in full, and all precautions they took to ensure that the animals did not suffer unduly during and after the experimental procedure.

The Editorial Board will not accept papers where the ethical aspects are, in the Board's opinion, open to doubt.

#### 1.5. *Originality of papers*

Submission of a paper to the Editorial Board is taken to imply that it reports work that has not been published in either the same or a substantially similar form, that it is not under consideration for publication elsewhere and that, if accepted for publication by *Clinical Science*, it will not be published elsewhere in the same form, either in English or in any other language, without the consent of the Editorial Board. This does not usually apply to previous publication of oral communications in brief abstract form. In such cases authors should enclose copies of the abstracts or previous publications. The author, or in the case of multiple authorship the authors, will be asked to sign a statement vesting the copyright in the publishers. Requests for consent for reproduction of material published in *Clinical Science* should be addressed to the Editorial Manager.

## 2. SUBMISSION OF MANUSCRIPTS: GENERAL INFORMATION AND FORMAT

### 2.1. *General*

Papers submitted for publication should be sent to the Editorial Manager, *Clinical Science*, 7 Warwick Court, London WC1R 5DP.

The submission should contain four copies (of which three may be photocopies) of the typescript, Tables, Figures etc. The authors should retain one copy of the paper. The Editorial Board does not accept responsibility for damage or loss of papers submitted, although great care is taken to ensure safety and confidentiality of the typescript during the editorial process. In the case of multiple authorship, the covering letter should indicate that the approval of all co-authors has been obtained and should be signed by all authors.

Papers should be presented so that they are intelligible to the non-specialist reader of the journal. This is particularly important in highly specialized fields and a very brief résumé of the current state of knowledge is usually helpful. Certain types of material, e.g. mathematical formulations requiring more than trivial derivations, should be given in a separate Appendix.

Where the reader is referred to previous works by the same author(s) for important details relevant to the present work, copies or reprints of the publication should be sent with the typescript. This is of particular importance in relation to methodology.

The dates of receipt and acceptance of the paper will be published. If the paper has to be returned to the authors for revision and is not resubmitted within 1 month, the date of receipt will be revised accordingly. Papers returned by authors later than 3 months after notification that revision is required will normally be treated as new submissions. For Short Communications the published date will always be that of receipt of the final version. It is emphasized that badly presented or unduly long papers will be returned for revision and delays in publication will be inevitable. Similar delays will be incurred if the typescript is not prepared strictly in accordance with the instructions detailed below.

**Typescripts of rejected work will not be returned to authors unless a specific request for the return has been made at the time of submission.**

### 2.2. *Full papers*

The authors should refer to a current issue of *Clinical Science* to make themselves familiar with the general layout. Concise presentation is very important for rising costs are a severe constraint on space. **The length of manuscript and the number of Figures and Tables must be kept to a minimum.** Extensive Tables of data can be deposited with the Royal Society of Medicine (see 2.5). *Guidance for Authors* is usually published in the January issue of the journal, and revised periodically.

Typescripts should be, in general, arranged as follows:

(a) *Title page*. Title: this should be as informative as possible, since titles of papers are being increasingly used in indexing and coding for information storage and retrieval. The title should indicate the species in which the observations reported have been made. The numbering of parts in a series of papers is not permitted.

List of authors' names (degrees and appointments are not required).

Laboratory or Institute of origin.

Key words: for indexing the subject of the paper; they should, if possible, be selected from the current issues of 'Medical Subject Headings' (MeSH), produced by the *Index Medicus*.

Short title: for use as a running heading in the printed text; it should not exceed forty-five characters and spaces.

Author for correspondence: the name and address of the author to whom queries and requests for reprints should be sent.

(b) *Summary*. This should be a brief statement arranged in **numbered paragraphs** of what was done, what was found and what was concluded and should rarely exceed 250 words. Abbreviations should be avoided as far as possible and must be defined. Statistical and methodological details including exact doses should also be avoided unless they are essential to the understanding of the summary.

(c) *Introduction*. This should be comprehensible to the general reader and should contain a clear statement of the reason for doing the work, but should not include either the findings or the conclusions.

(d) *Methods*. The aim should be to give sufficient information in the text or by reference to permit the work to be repeated without the need to communicate with the author.

(e) *Results*. This section should not include material appropriate to the Discussion section.

(f) *Discussion*. This should not contain results and should be pertinent to the data presented.

(g) *Acknowledgments*. These should be as brief as possible.

(h) *References*. See p. v for the correct format.

(i) *Figures and Tables*. See p. iv.

### 2.3. Short Communications

The passage of Short Communications through the editorial process can frequently be expedited, and contributors are encouraged to take advantage of these facilities when rapid publication is of importance and when material can be presented concisely. The Short Communication should describe completed work and not be merely a preliminary communication. The format of Short Communications should be similar to that of full

papers but should not exceed 1200 words of text. **One Figure or Table** is allowed, but if neither is included the text may be expanded to 1400 words. **If a Short Communication requires major revision or resubmission it will not be given priority for publication** and will be handled as for a full paper. Occasionally, authors who have submitted a full paper may be given the option of re-submitting their work in the Short Communication format. Such re-submissions will not normally be given priority for publication over other papers.

### 2.4. Correspondence

Letters containing original observations or critical assessments of material published in *Clinical Science*, including Editorial Reviews, will be considered for the Correspondence section of the journal. Letters should be no longer than 750 words, with one Figure or Table and up to six references, or 1000 words maximum without a Figure or Table. Letters relating to material previously published in *Clinical Science* should be submitted within 6 months of the appearance of the article concerned. They will be sent to the authors for comment and both the letter and any reply by the author will be published together. Further correspondence arising therefrom will also be considered for publication. Consideration will also be given to publication of letters on ethical matters.

### 2.5. Arrangements for large amounts of information

It is impracticable to publish very large sets of individual values or very large numbers of diagrams, and under these circumstances a summary of the information only should be included in the paper. The information from which the summary was derived should be submitted with the typescript and, if the latter is accepted, the Editors may ask for a copy of the full information and diagrams to be deposited with the Librarian, the Royal Society of Medicine, 1 Wimpole Street, London W1M 8AE, who will issue copies on request. Experience has shown that such requests are frequently received.

### 2.6. Proof corrections

These are expensive and corrections of other than printers' errors may have to be charged to the author.

### 2.7. Offprints

Fifty offprints are supplied free and additional copies may be obtained at terms, based upon the cost of production, that will be given with the proofs. All offprints should be ordered when the proofs are returned.

## 2.8. Availability on MEDLINE

Summaries of papers in *Clinical Science* are available on-line on teleprinters participating in the MEDLINE system run by the National Library of Medicine, National Institutes of Health, Bethesda, Maryland, U.S.A.

## 3. MISCELLANEOUS NOTES

### 3.1. Abbreviations

Abbreviations should be avoided; if used they must be defined at the first mention; new abbreviations should be coined only for unwieldy names which occur frequently. Abbreviations should not appear in the title nor, if possible, in the Summary. A list of accepted abbreviations is on p. vii. Numbers, not initials, should be used for patients and subjects.

### 3.2. Anatomical nomenclature

This should follow the recommendations of the International Anatomical Nomenclature Committee (1966) *Nomina Anatomica*, 3rd edn, Excerpta Medica Foundation, Amsterdam.

### 3.3. Animals, plants and micro-organisms

The full binomial specific names should be given at first mention for all experimental animals other than common laboratory animals. The strain and, if possible, the source of laboratory animals should be stated. Thereafter in the text, single letter abbreviations may be given for the genus; if two genera with the same initial letter are studied, abbreviations such as *Staph.* and *Strep.* should be used.

### 3.4. Buffers and salts

The acidic and basic components should be given, together with the pH. Alternatively, a reference to the composition of the buffer should be given. Further details are provided in the *Biochemical Journal* (1984) **217**, 9.

When describing solutions containing organic anions and their parent acids, the salt designator (e.g. lactate, urate, oxalate) should be used in preference to the name of the acid (lactic, uric, oxalic) unless it is certain that virtually all of the acid is in the undissociated form.

The composition of incubation media should be described, or a reference to the composition should be given.

### 3.5. Computer modelling

Papers concerned primarily with computer modelling techniques are acceptable provided that use of such techniques leads to a clear choice between two or more alternative hypotheses, or to the formulation of a new hypothesis amenable to

experimental challenge or verification, or provides some new insight into the behaviour of a particular physiological system. Extensive technical details of hardware and software should not be given.

### 3.6. Doses

Doses of drugs should be expressed in mass terms, e.g. milligrams (mg) or grams (g), and also (in parentheses) in molar terms, e.g. mmol, mol, where this appears to be relevant. Molecular weights of many drugs may be found in *The Merck Index*, 8th edn, Merck and Co. Inc., N.J., U.S.A.

### 3.7. Enzymes

Nomenclature should follow that given in *Enzyme Nomenclature* (1978), Academic Press, London and New York, and the Enzyme Commission (EC) number should be quoted at the first mention. Where an enzyme has a commonly used informal name, this may be employed after the first formal identification. A unit of enzyme activity should preferably be expressed as that amount of material which will catalyse transformation of 1  $\mu$ mol of the substrate/min under defined conditions, including temperature and pH. Alternatively, or when the natural substrate has not been fully defined, activity should be expressed in terms of units of activity relative to that of a recognized reference preparation, assayed under identical conditions. Activities of enzymes should normally be expressed as units/ml or units/mg of protein.

### 3.8. Evaluation of measurement procedures

When a new measuring procedure has been used, or when an established procedure has been applied in a novel fashion, an estimate of the precision of the procedure should be given. This should, as far as possible, indicate what sources of variation have been included in this estimate, e.g. variation of immediate replication, variation within different times of day, or from day to day etc.

If the precision of measurement varies in proportion to the magnitude of the values obtained, it can best be expressed as the coefficient of variation; otherwise it should be expressed by an estimate of the (constant) standard error of a single observation, or by estimates at several points within the range of observed values.

When recovery experiments are described the approximate ratio of the amount added to the amount already present and the stage of the procedure at which the addition was made should be stated.

### 3.9. Figures and Tables

These are expensive to print and their number should be kept to a minimum. Their appropriate position in the paper should be indicated in the

margin of the text. References to Figures and Tables should be in Arabic numerals, e.g. Fig. 3, and they should be numbered in order of appearance. In general, the same data should not be presented in both a Figure and a Table.

Figures, with captions attached, should be supplied as original drawings or matt photographs together with photocopies. All Figures should have their number and the authors' names written in pencil on the back; the top of the Figure should be indicated with a pencilled arrow. Acceptable symbols for experimental points are ●, ▲, ■, ○, △, □. The symbols × or + must be avoided. The same symbols must not be used for two curves where the points might be confused. For scatter diagrams, solid symbols are preferred. When a particular variable appears in more than one Figure, the same symbol should be used for it throughout, if possible.

Curves should not be drawn beyond the experimental points, nor should axes extend appreciably beyond the data. Only essential information that cannot readily be included in the legend should be written within the Figure.

Figures for half-tone reproduction should be submitted as glossy prints. They are particularly expensive to print and their use should be avoided as far as possible.

Tables should be typed separately from the text. They should have an underlined title followed by any legend.

Captions for the Figures, and titles and legends for the Tables, should make them **readily understandable** without reference to the text. Adequate statistical information, including that on regression lines, should be included in Figure captions where appropriate.

### 3.10. Footnotes

These should be avoided as far as possible but where they are used in Tables they should be identified by the symbols \* † ‡ § || ¶, in that order.

### 3.11. Isotope measurements

The information given should include (a) conditions of radioactivity counting, e.g. infinitely thick, infinitely thin; (b) the nature of the phosphor used in liquid-scintillation counting; (c) details of corrections made to the observed count rate, e.g. for 'quenching' or 'cross-over'; (d) standard deviation of the results or a statement of the minimum total counts above background collected and the background value.

In general the specific radioactivity of the starting materials should be given, preferably in terms of radioactivity per unit weight or, for stable isotopes, as atoms % excess.

Pending the general introduction of SI units radioactivity should continue to be expressed in terms of the curie (Ci) followed by the corresponding figure in terms of the becquerel (Bq; disintegrations/s), in parentheses, and suitably rounded.

### 3.12. Radionuclide applications in man

If new or modified radionuclide applications in man are described, an estimate of the maximal possible radiation dose to the body and critical organs should be given.

For the time being this can continue to be expressed in rems, but with the corresponding figure in sieverts (Sv) given in parentheses after it.

### 3.13. Methods

In describing certain techniques, namely centrifugation (when the conditions are critical), chromatography and electrophoresis, authors should follow the recommendations published by the Biochemical Society (currently, *Biochemical Journal* (1985) 225, 1-26).

### 3.14. Nomenclature of disease

This should follow the *International Classification of Disease* (8th revision, World Health Organization, Geneva, 1969) as far as possible.

### 3.15. Powers in Tables and Figures

Care is needed where powers are used in Table headings and in Figures to avoid numbers with an inconvenient number of digits. For example: (i) an entry '2' under the heading  $10^3 k$  means that the value of  $k$  is 0.002; an entry '2' under the heading  $10^{-3} k$  means that the value of  $k$  is 2000. (ii) A concentration 0.00015 mol/l may be expressed as 0.15 under the heading 'concn. (mmol/l)' or as 150 under the heading 'concn. ( $\mu$ mol/l)' or as 15 under the heading ' $10^5 \times$  concn. (mol/l)', but not as 15 under the heading 'concn. (mol/l  $\times 10^{-5}$ )'.

### 3.16. References

The numerical citation system is now used: references in the text are numbered consecutively in the order in which they are first mentioned, the numerals being given in brackets, e.g. [22]. References cited in Figure legends or Tables only should be numbered in a sequence determined by the position of the first mention in the text of the Figure or Table. References should be listed in numerical order and the names of all authors of a paper should be given, with the full title of the paper and the source details in full including the first and last page numbers, e.g.

2. Clark, T.J.H., Freedman, S., Campbell, E.J.M. & Winn, B.R. (1969) The ventilatory capacity of patients

with chronic airways obstruction. *Clinical Science*, 36, 307-316.

When the quotation is from a book, the following format should be used, giving the relevant page or chapter number:

20. Mollison, P.L. (1967) *Blood Transfusion in Clinical Medicine*, 4th edn, p. 50. Blackwell Scientific Publications, Oxford
22. Reid, L. (1968) In: *The Lung*, p. 87. Ed. Liebow, A.A. & Smith, D.E. Williams and Wilkins, Baltimore.

References to 'personal communications' and 'unpublished work' should appear in the text only and not in the list of references. The name and initials of the source of information should be given. When the reference is to material that has been accepted for publication but has not yet been published, this should be indicated in the list of references by 'In press' together with the name of the relevant journal and, if possible, the expected date of publication. If such a citation is of major relevance to the manuscript submitted for publication authors are advised that the editorial process might be expedited by the inclusion of a copy of such work. In the case of quotations from personal communications the authors should state in the covering letter that permission for quotation has been obtained.

### 3.17. Solutions

Concentration of solutions should be described where possible in molar terms (mol/l and subunits thereof), stating the molecular particle weight if necessary. Values should not be expressed in terms of normality or equivalents. Mass concentration should be expressed as g/l or subunits thereof, for example mg/l or  $\mu\text{g/l}$ . For solutions of salts, molar concentration is always preferred to avoid ambiguity as to whether anhydrous or hydrated compounds are used. Concentrations of aqueous solutions should be given as mol/l or mol/kg (g/l or g/kg if not expressed in molar terms) rather than % (w/v) or % (w/w). It should always be made clear whether concentrations of components in a reaction mixture are final concentrations or the concentrations in solutions added.

### 3.18. Spectrophotometric data

The term 'absorbance' [ $\log(I_0/I)$ ] should be used rather than 'optical density' or 'extinction'. The solvent, if other than water, should be specified. Symbols used are: *A*, absorbance; *a*, specific absorption coefficient ( $\text{litre g}^{-1} \text{cm}^{-1}$ ) (alternatively use  $A_{1\text{cm}}^{1\%}$ );  $\epsilon$ , molar absorption coefficient (the absorbance of a molar solution in a 1 cm light-path) ( $\text{litre mol}^{-1} \text{cm}^{-1}$ , not  $\text{cm}^2 \text{mol}^{-1}$ ).

### 3.19. Spelling

*Clinical Science* uses as standards for spelling the *Concise* or *Shorter Oxford Dictionary of Current English* (Clarendon Press, Oxford) and *Butterworth's Medical Dictionary* (Butterworths, London).

### 3.20. Statistics

Papers are frequently returned for revision (and their publication consequently delayed) because the authors use inappropriate statistical methods. Two common errors are the use of means, standard deviations and standard errors in the description and interpretation of grossly non-normally distributed data and the application of *t*-tests for the significance of difference between means in similar circumstances, or when the variances of the two groups are non-homogeneous. In some circumstances it may be more appropriate to provide a 'scattergram' than a statistical summary.

A reference should be given for all methods used to assess the probability of a result being due to chance. The format for expressing mean values and standard deviations or standard errors of the mean is, for example: mean cardiac output 10.4 l/min (SD 1.2;  $n = 11$ ). Degrees of freedom should be indicated where appropriate. Levels of significance are expressed in the form  $P < 0.01$ .

### 3.21. Trade names

The name and address of the supplier of special apparatus and of biochemicals should be given. In the case of drugs, approved names should always be given with trade names and manufacturers in parentheses.

## 4. UNITS: THE SI SYSTEM

The recommended *Système International* (SI) units [see *Quantities, Units and Symbols*, 2nd edn (1975) The Royal Society, London] are used by *Clinical Science*. All papers submitted should use these units except for blood pressure values, which should be expressed in mmHg, or gas tensions, where values at the author's discretion may be given in mmHg (with kPa in parentheses) or as kPa (with mmHg in parentheses) in the text and either as mmHg or as kPa in Figures, which (if practicable) should have scales in both units. Airways pressure should be expressed in kPa. Where molecular weight is known, the amount of a chemical or drug should be expressed in mol or in an appropriate subunit, e.g. mmol. Energy should be expressed in joules (J).

The basic SI units and their symbols are as follows:

Physical quantity	Name	Symbol
length	metre	m
mass	kilogram	kg
time	second	s
electric current	ampere	A
thermodynamic temperature	kelvin	K
luminous intensity	candela	cd
amounts of substance	mole	mol

The following are examples of derived SI units:

Physical quantity	Name	Symbol	Definition
energy	joule	J	$\text{kg m}^2 \text{s}^{-2}$
force	newton	N	$\text{kg m s}^{-2} = \text{J m}^{-1}$
power	watt	W	$\text{kg m}^2 \text{s}^{-3} = \text{J s}^{-1}$
pressure	pascal	Pa	$\text{kg m}^{-1} \text{s}^{-2} = \text{N m}^{-2}$
electric charge	coulomb	C	A s
electric potential difference	volt	V	$\text{kg m}^2 \text{s}^{-2} \text{A}^{-1} = \text{J A}^{-1} \text{s}^{-1}$
electric resistance	ohm	$\Omega$	$\text{kg m}^2 \text{s}^{-3} \text{A}^{-2} = \text{V A}^{-1}$
electric conductance	siemens	S	$\text{kg}^{-1} \text{m}^{-2} \text{s}^3 \text{A}^2 = \Omega^{-1}$
electric capacitance	farad	F	$\text{A}^2 \text{s}^3 \text{kg}^{-1} \text{m}^{-2} = \text{A s V}^{-1}$
frequency	hertz	Hz	$\text{s}^{-1}$
volume	litre	l	$10^{-3} \text{ m}^3$

The word 'litre' has been accepted as a special name for cubic decimetre (1 litre = 1 dm<sup>3</sup>).

Both the basic and derived SI units, including the symbols of derived units that have special names, may be preceded by prefixes to indicate multiples and submultiples. The prefixes should be as follows:

Prefix	Symbol	Multiple	Prefix	Symbol	
10 <sup>6</sup>	mega	M	10 <sup>-3</sup>	milli	m
10 <sup>3</sup>	kilo	k	10 <sup>-6</sup>	micro	$\mu$
10 <sup>2</sup>	hecto	h*	10 <sup>-9</sup>	nano	n
10	deka	da	10 <sup>-12</sup>	pico	p
10 <sup>-1</sup>	deci	d*	10 <sup>-15</sup>	femto	f
10 <sup>-2</sup>	centi	c*			

\* To be avoided where possible (except for cm).

Compound prefixes should not be used, e.g. 10<sup>-9</sup> m should be represented by 1 nm, not 1 m $\mu$ m.

Notes:

(i) Full stops are not used after symbols.

(ii) Minutes (min), hours (h), days and years will continue to be used in addition to the SI unit of time [the second (s)].

(iii) The solidus may be used in a unit as long as it does not have to be employed more than once, e.g. mmol/l is acceptable, but ml/min/kg is not, and should be replaced by ml min<sup>-1</sup> kg<sup>-1</sup>.

## 5. ABBREVIATIONS, CONVENTIONS, DEFINITIONS, SYMBOLS AND SPECIAL COMMENTS

As well as standard symbols and abbreviations that have been accepted by international bodies, and which can be used without definition, this list shows selected abbreviations in the form of groups of capital letters (e.g. ALA, ECF, MCHC) which when used must be defined in the text as indicated on p. iv. The standard abbreviations for amino acids are only for use in Figures and Tables or for peptide sequences.

absorbance	A
acceleration due to gravity	g
adenosine 3':5'-cyclic mono-phosphate	cyclic AMP
adenosine 5'-phosphate	AMP
adenosine 5'-pyrophosphate	ADP
adenosine 5'-triphosphate	ATP
adenosine triphosphatase	ATPase
adrenocorticotrophic hormone	ACTH
adrenoceptor (see also blocking agents)	
alanine	Ala
alternating current	a.c.
alveolar minute ventilation	$\dot{V}_A$
alveolar to arterial oxygen tension difference	( $P_{A,O_2} - P_{a,O_2}$ )
ampere	A
aminolaevulinic acid	ALA
angiotensin	ANG; reference amino acid abbreviations are used as prefix within brackets: e.g. [Sar <sup>1</sup> , Val <sup>5</sup> , Ala <sup>8</sup> ]ANG
Ångstrom (Å)	not used; express in nm (1 Ångstrom = 10 <sup>-10</sup> m)
antidiuretic hormone	ADH (when referring to the physiological secretion)
arginine	Arg
arteriovenous	a-v: permitted in Figures and Tables
asparagine	Asn
aspartic acid	Asp
atmosphere (unit of pressure)	not used; express in kPa (1 atmosphere = 101.325 kPa)
atomic weight	at. wt.
becquerel	Bq (1 d.p.s.)
blocking agents	e.g. $\beta$ -adrenoceptor antagonists preferred
blood pressure	express in mmHg
blood urea nitrogen	not used; recalculate as urea, express in mmol/l
blood volume	BV
body temperature and pressure, saturated	BTPS
British Pharmacopoeia calculated	write in full and give edition calc. (in Tables only)
'Calorie' (= 1000 cal)	not used; recalculate as kilojoules (1 'Calorie' = 4.184 kJ)

carbon dioxide output (in respiratory physiology)	$\dot{V}_{\text{CO}_2}$ ; express in ml STP/min	extinction	use absorbance
cardiac frequency	$f_c$ ; in beats/min	extracellular fluid	ECF
cardiac output	express in l/min	extracellular fluid volume	ECFV
centimetre	cm	extraction ratio of x (renal)	$E_x$
clearance of x	$C_x$	Figure (with reference numeral)	Fig.; plural, Figs.
coenzyme A and its acyl derivatives	CoA and acyl-CoA	filtered load of x (renal)	$F_x$
compare	cf.	follicle-stimulating hormone	FSH
complement fractions	C1-C9	forced expiratory volume in 1.0 s	FEV <sub>1,0</sub>
compliance (respiratory physiology)	C; express in l kPa <sup>-1</sup>	fractional concentration in dry gas	F
concentrated	conc.	fractional disappearance rate	k (as in $A = A_0 e^{-kt}$ )
concentration	concn.; may be denoted [ ]; e.g. plasma [HCO <sub>3</sub> <sup>-</sup> ]	frequency of respiration	$f_R$ ; in breaths/min
conductance (respiratory physiology)	G; express in l s <sup>-1</sup> kPa <sup>-1</sup>	functional residual capacity	FRC
correlation coefficient	r: may be used without definition	gas-liquid chromatography	g.l.c.
counts/min, counts/s	c.p.m., c.p.s.	gas transfer factor	T; in mmol min <sup>-1</sup> kPa <sup>-1</sup>
cubic centimetres	use ml	glomerular filtration rate	GFR
curie	Ci (1 Ci = 3.7 × 10 <sup>10</sup> d.p.s.)	glutamic acid	Glu
cycle/s	Hz	glutamine	Gln
cysteine	Cys	glutathione	GSH (reduced); GSSG (oxidized)
dates	e.g. 11 August 1970	glycine	Gly
dead-space minute ventilation	$\dot{V}_D$	gram(me)	g
dead-space volume	$V_D$	gravitational field, unit of (9.81 m s <sup>-2</sup> )	g
degrees, Celsius or centigrade	°C	growth hormone	GH; if human, HGH
deoxy (prefix)	not desoxy	guery	Gy (100 rads)
deoxycorticosterone	DOC	haematocrit	not allowed; use packed cell volume (PCV)
deoxycorticosterone acetate	DOCA	haemoglobin	Hb; express in g/dl
deoxyribonucleic acid	DNA	half-life	$t_{1/2}$
dialysate	diffusate preferred; 'dialysate' should be clearly defined	hertz (s <sup>-1</sup> )	Hz
diethylaminoethylcellulose	DEAE-cellulose	histidine	His
differential of x with respect to time	$\dot{x}$ (= dx/dt)	hour	h
1,25-dihydroxycholecalciferol	1,25-(OH) <sub>2</sub> D <sub>3</sub>	human chorionic gonadotropin	HCG
dilute	dil.	human placental lactogen	HPL
2,3-diphosphoglycerate	2,3-DPG	hydrocortisone	use cortisol
direct current	d.c.	hydrogen ion activity minus log of	aH; express in nmol/l pH
disintegrations/min	d.p.m.	25-hydroxycholecalciferol	25-(OH)D <sub>3</sub>
disintegrations/s	d.p.s.	hydroxyproline	Hyp
dissociation constant		immunoglobulins	IgA, IgD, IgE, IgG, IgM
acidic	$K_a$	injection routes:	use abbreviations only in Figures
basic	$K_b$	intra-arterial	i.a.
apparent	e.g. $K'_d$	intramuscular	i.m.
minus log of	pK	intrapitoneal	i.p.
doses	avoid Latin designations such as b.d. and t.i.d.	intravenous	i.v.
dync	dyn; used for vascular resistance	subcutaneous	s.c.
elastance	E; express in Pa m <sup>-3</sup>	international unit	i.u. (definition and reference should be given for uncommon or ambiguous applications, e.g. enzymes);
electrocardiogram	ECG	intracellular fluid	ICF
electroencephalogram	EEG	intracellular fluid volume	ICFV
electromotive force	e.m.f.	ionic strength	I
electron spin resonance	e.s.r.	isoleucine	Ile
electronvolt	eV (for radiation energies)	isotonic	not used; specify composition of fluid, e.g. NaCl, 150 mmol/l
equation	eqn.	isotopically labelled compounds	e.g. [U- <sup>14</sup> C]glucose, [1- <sup>14</sup> C]glucose, sodium [1- <sup>14</sup> C]acetate; use <sup>131</sup> I-labelled albumin, not [ <sup>131</sup> I]albumin
equivalents (amount of a chemical)	not used; recalculate in molar terms	joule	for simple molecules: <sup>14</sup> CO <sub>2</sub> , <sup>3</sup> H <sub>2</sub> O
erythrocyte count	express as 10 <sup>12</sup> cells/l	kilogram(me)	J
erythrocyte sedimentation rate	ESR	kilopond	kg
ethanol, ethanolic	not ethyl alcohol or alcoholic	lactate dehydrogenase	not used; 1 kilopond = 9.8067 N
ethylenediaminetetra-acetate	EDTA	leucine	LDH
exchangeable	Na <sub>e</sub> , K <sub>e</sub> etc., for total exchangeable sodium, potassium etc.		Leu
Experiment (with reference numeral)	Expt.; plural, Expts.		
expired minute ventilation	$\dot{V}_E$		

leucocyte count	express as $10^9$ cells/l	arterial, of $\text{CO}_2$	$P_{\text{aCO}_2}$
lipoproteins (serum)		capillary, of $\text{O}_2$	$P_{\text{cPaO}_2}$
high density	HDL	mixed venous, of $\text{CO}_2$	$P_{\text{vCO}_2}$
low density	LDL		Pa
very low density	VLDL		/
litre	l (write in full if confusion with the numeral 1 is possible)	per cent	%
logarithm (base 10)	log	petroleum ether	<i>not used; use light petroleum and give boiling range</i>
logarithm (base e)	ln	phenylalanine	Phe
lutening hormone	LH	plasma renin activity	express as pmol of angiotensin $\text{I h}^{-1} \text{ ml}^{-1}$
lysine	Lys		PV
maximum	max.	plasma volume	1 poise = $10^{-1} \text{ N s m}^{-2}$
mean corpuscular haemoglobin	MCH; express in pg	poise	p.d.
mean corpuscular haemoglobin concentration	MCHC; express in g/dl	potential difference	power output
mean corpuscular volume	MCV; express in fl ( $1 \mu\text{m}^3 = 1 \text{ fl}$ )	precipitate	$W (1 W = 0.1635 \text{ kpm/min})$
median lethal dose	$\text{LD}_{50}$	pressure	ppt.
meta-	m-		$P$ ; express in kPa (except for blood pressures and gas tensions: see p. vi); 1 kPa = 7.5 mm Hg
melting point	m.p.		$P$
methanol, methanolic	<i>not methyl alcohol</i>	probability of an event being due to chance alone	Pro
methionine	Met	proline	PBI
metre	m	protein-bound iodine (plasma)	$\dot{Q}_c$
Michaelis constant	$K_m$	pulmonary capillary blood flow	PPi
micromole	$\mu\text{mol}$	pyrophosphate (inorganic)	<i>not abbreviated</i>
micron ( $10^{-6} \text{ m}$ )	$\mu\text{m}$ ; <i>not <math>\mu</math></i>	rad (radiation dose; $10^{-5} \text{ J absorbed/g of material}$ )	(100 rads = 1 Gy)
milliequivalent	<i>not used; give amount in mmol</i>	red blood cell	<i>use erythrocyte; express counts as <math>10^{12}</math> cells/l</i>
millilitre	ml		$R_F$
millimetre of mercury	mmHg; for blood pressure and, at authors' discretion, for gas tensions: see p. vi (1 mmHg = 0.133 kPa)	relative band speed (partition chromatography)	100 ergs/s x quality factor
millimolar (concentration)	mmol/l; <i>not mm</i>	rem	<i>see plasma renin activity</i>
millimole	mmol	renin	RV
minimum	min.	residual volume	$R$ ; express in $\text{kPa l}^{-1} \text{ s}$
minute (60 s)	min	resistance (rheological)	$R$
molal	mol/kg	respiratory exchange ratio (pulmonary)	RQ
molar (concentration)	mol/l; <i>not M</i>	respiratory quotient (metabolic)	rev.
molar absorption coefficient	$\epsilon$ (the absorbance of a molar solution in a 1 cm light-path)	revolutions	<i>not r.p.m.; use g if possible (see p. viii)</i>
mole	mol	rev./min	RNA
molecular weight	mol. wt.		R
nicotinamide-adenine dinucleotide	NAD if oxidation state not indicated NAD <sup>+</sup> if oxidized NADH if reduced NADP if oxidation state not indicated NADP <sup>+</sup> if oxidized NADPH if reduced	ribonucleic acid	define at first mention [e.g. NaCl solution (154 mmol/l)]
nicotinamide-adenine dinucleotide phosphate	should not be used to denote the concentration or osmolarity of a solution	röntgen	$S$ , e.g. $S_{\text{aO}_2}$ , for arterial oxygen saturation (see partial pressure for other analogous abbreviations)
normal	<i>use standard temperature and pressure (STP)</i>	saline	$s$
normal temperature and pressure	n.m.r.	saturation	Ser
nuclear magnetic resonance	no. (in Tables only)		Sv (1 J/kg x quality factor)
number (in enumerations)	obs. (in Tables only)	second (time)	e.g. butanol/acetic acid/water (4:1:1, by vol.), butanol/acetic acid (4:1, v/v)
observed	$\Omega$	serine	sp., plural spp.
ohm	Orn	sievert	sp. act. Confusion must be avoided between e.g. specific radioactivity and the specific activity of an enzyme
ornithine	<i>o-</i>	solvent systems	$sGaw$ ; express in $\text{s}^{-1} \text{ kPa}^{-1}$
ortho-	$P_i$	species	SD } may be used
orthophosphate (inorganic)	express in osmol (or mosmol)/l	specific activity	SEM } without definition
osmolarity	$\dot{V}_{\text{O}_2}$ ; express in ml STP/min	specific conductance of airways	STP
oxygen uptake per minute (in respiratory physiology)	PCV	standard deviation	
packed cell volume	p., pp.	standard error of the mean	
page, pages	<i>p-</i>	standard temperature and pressure	
para-	PAH	steroid nomenclature	<i>see Biochemical Journal</i> (1969) 113, 5-28; (1972) 127, 613-617
para-aminohippurate	$P$ ; express in either kPa or mmHg (see p. vi)		
partial pressure	$PAO_2$		
e.g. alveolar, of $\text{O}_2$			

sulphydryl	use thiol or SH	variance ratio	$F$
sum	$\Sigma$	vascular resistance	express in $\text{kPa l}^{-1} \text{s}$ (with value in $\text{dyn s cm}^{-5}$ in parentheses); primary values of differential vascular pressure (mmHg) and flow (l/min) should always also be given in Tables or text as appropriate
Svedberg unit	S		$v$ ; express as $\text{m s}^{-1}$
temperature (absolute)	$T$	velocity	$\dot{Q}_{va}$
temperature (empirical)	$t$	venous admixture	used only for buffer mixtures; otherwise use 5,5'-diethylbarbituric acid
temperature, thermodynamic	$^{\circ}\text{K}$	veronal	
thin-layer chromatography	t.l.c.	viscosity, dynamic	$\eta$
threonine	Thr	viscosity, kinematic	$\nu$
thyrotrophic hormone	TSH	vital capacity	VC
thyrotrophin-releasing hormone	TRH	volt	V
tidal volume	$V_T$	volume of blood (in cardio-respiratory physiology)	$\dot{Q}$ ; use $\dot{Q}$ for blood flow rate
time (symbol)	$t$	watt	W
time of day	e.g. 18.15 hours	wavelength	$\lambda$
torr	not used; use kPa (1 torr = 0.133 kPa)	weight	wt.
		white blood cell	use leucocyte; express counts as $10^9 \text{ cells/l}$
total lung capacity	TLC		
tryptophan	Trp		
tubular maximal reabsorptive capacity for x	$T_{m,x}$		
tyrosine	Tyr		
ultraviolet	u.v.		
urinary concentration of x	$U_x$		
valency	e.g. $\text{Fe}^{2+}$ , <i>not</i> $\text{Fe}^{++}$		
valine	Val

 Sensory scaling 131-140  
 Serine, hepatic ammoniogenesis, uraemia 627-634  
 Short-chain fatty acids, diffusion in colonic muscles 271-276  
 Skeletal muscle *see* Muscle, skeletal  
 Skin  
   blood flow, foot 577-582  
   perfusion pressure 249-255  
   vascular resistance 249-255  
 Smooth muscle *see* Muscle, smooth  
 Sodium  
   atrial natriuretic factor 327-331  
   cerebrospinal fluid 103-110  
   hydrochlorothiazide, renal function 379-387  
   kallikrein inhibition 13-17  
   natriuretic hormone 103-110  
 Sodium bicarbonate, prostaglandin E excretion 141-145  
 Sodium, potassium-dependent adenosine triphosphatase, inhibitor 103-110  
 Sodium pump inhibitor 103-110

- Sodium transport  
 essential hypertension 611-616  
 inhibitor, essential hypertension 583-586
- Somatostatin, ventilation control 547-554
- Steroid  $\beta$ -hydroxylase, omeprazole 99-102
- ST segment/heart rate slope 601-609
- Streptozotocin-induced diabetes mellitus 11-117
- Stroke volume, adrenaline 199-206
- Subcutaneous blood flow, reflex control 513-522
- Sucrase, jejunal brush border 617-626
- Sulindac  
 prostaglandin synthesis 501-505  
 renal haemodynamics 243-247
- Superoxide dismutase, alcoholism 365-369
- Sympathetic reflex, blood flow 321-325
- Systemic sclerosis, polymorphonuclear leucocytes 257-261
- Systems theory, urea synthesis 31-38
- Tetraplegia, skeletal muscle blood flow 321-325
- Thermogenesis, skeletal muscle  $\beta$ -adrenoceptor blockade 435-441
- Thermoregulation, foot skin blood flow 577-582
- Thrombin, platelet catecholamine release 495-500
- Thromboxane B, angiotensin II 527-530
- Tissue preservation 443-452
- Tooth, dentine in osteogenesis imperfecta 339-346
- Transplantation preservation fluids 443-452
- Transport  
 cations, essential hypertension 611-616  
 rubidium 263-269, 611-616  
 sodium, leucocytes 583-586
- Tubular absorption, myoglobin 595-599
- Uraemia, hepatic gluconeogenesis and ammoniogenesis 627-634
- Urea  
 hepatocyte formation, uraemia 627-634  
 short-term synthesis rate 31-38
- Ureagenesis, liver, uraemia 627-634
- Urinary tract infections 531-538\*
- Urine, pathogens, virulence factors 531-538\*
- Urogastrone-epidermal growth factor, prostate gland 359-363
- Valsalva manoeuvre, baroreflex sensitivity 489-494
- Vascular resistance  
 adrenaline 199-206  
 skeletal muscle 321-325  
 skin 249-255
- Vasodilatation, calcitonin gene related peptide 389-393
- Vasopressin  
 baroreflex mechanisms 307-315\*  
 posture 177-184  
 renal prostaglandins 371-377  
 vascular receptor antagonist 191-198
- Veno-arteriolar reflex 321-325
- Venous tone, pregnancy-induced hypertension 155-157
- Ventilation  
 almitrine 555-564  
 naloxone 547-554  
 prochlorperazine 547-554  
 somatostatin 547-554  
 stimulation 131-140
- Verapamil, blood pressure, renal function 453-460
- Water  
 atrial natriuretic factor 327-331  
 clearance, arginine vasopressin 409-416  
 diabetes mellitus 111-117  
 immersion, natriuresis 523-526  
 salt intake 185-189
- Zinc, muscle,  
 dieting, obesity 285-293
